Safety instructions

It is necessary to read and understand the contents described in this chapter before using robots.

In this Manual, the robot system refers to an integrated system integrating the industrial robot and its controller, teach pendant, cables, software and other accessories. So, it is required to fully consider the safety precautions of the user and the system.

Nobody is allowed to modify the industrial robot without authorization from Agilebot Robotics Co., Ltd. Agilebot Robotics Co., Ltd. shall assume no responsibility for any damage to the industrial robot or its components due to the use of any other components (software, tools, etc.) not provided by Agilebot.

Agilebot Robotics Co., Ltd. assumes no responsibility for any consequences caused by misuse of the industrial robot. The misuse includes:

- > Use the robot beyond the specified parameter range
- Use it as a carrier for humans or animals
- Use it as a climbing tool
- Use it in explosive environments
- Use it without safety protection

Besides safety precautions in this chapter, this Manual contains other safety instructions, which must be followed as well.

Definition of user

The operators are defined as follows:

> Operator

Perform power-on/off operation on the robot.

Start the robot program from the panel board.

Robot Engineer

Operate the robot.

Perform teaching and programming debugging of the robot within the safety fence.

> Maintenance Engineer

Operate the robot.

Perform teaching of the robot within the safety fence.

Carry out maintenance (repair, adjustment, replacement) operations on the robot.

The "Operator" is not allowed to enter the safety fence.

The "Robot Engineer" and "Maintenance Engineer" can carry out operations within the safety fence.

The operations within the safety fence include handling, setting, teaching, adjustment, maintenance, etc.

To carry out the operations within the safety fence, it is necessary to receive professional training on the robot.

When operating, programming and maintaining the robot, the operator, programmer and maintenance engineer must give a safety warning and wear at least the following protective articles.

- Work clothes suitable for operations
- Safety shoes
- > Safety helmets

System authority for operators

Operator

Operator's authorities include:

- 1) Turn on/off the robot.
- 2) Use the handheld teach pendant to teach the robot; select, debug, run, start, pause and abort the programs.
- 3) Switch the currently loaded TF/UF and modify overall velocity parameters through the above status bar on the teach pendant screen.
- 4) Allow operations, e.g. moving to the target point.
- 5) Review alarms and reset regular alarms.
- 6) Perform the operations of I/O status interface and register interface.

🗓 Warning

- 1. The "Operator" is not allowed to enter the safety fence.
- 2. The operations within the safety fence include handling, setting, teaching, adjustment, maintenance, etc.
- 3. To carry out the operations within the safety fence, it is necessary to receive professional training on the robot.
- 4. When operating, programming and maintaining robots, the operator, programmer and maintenance technicians must be careful and wear protective equipment, such as work clothes, safety shoes and safety helmets suitable for relevant work.

Robot engineer

The authority of the robot engineer includes:

- 1) All authorities of the operators
- 2) Setting of robot's zero point, setting of soft limit, establishment and editing of coordinate system
- 3) I/O configuration and management
- 4) Communication configuration
- 5) Creation, editing, revision, deletion and other robot program management functions
- 6) Creation and setting of various registers
- 7) Management function of robot program attributes
- 8) Setting of program launch mode
- 9) Backup and loading of files
- 10) Setting of IP/TP IP address of controller main board

11) Setting of system time

Administrator

The authorities of administrator include:

- 1) All authorities of the operator and robot engineer
- 2) Software installation and upgrading
- 3) Management of programmer roles, which can be added, deleted or edited

Definition of safety records

This Manual includes safety warnings to ensure personal safety of the users and avoid any damage to the machine tool and describes them with "Danger" and "Warning" in the main text based on their importance in safety.

In addition, relevant additional descriptions are described as "Caution".

Before use, the user must thoroughly read the precautions described in "Danger", "Warning" and "Caution".

Identification	Definition
A Danger	It indicates dangerous situations possibly resulting in serious injury or death to the user during incorrect operation.
Marning	It indicates dangerous situations possibly resulting in mild or moderate personal injury or property damage during incorrect operation.
A Caution	It provides additional descriptions outside the scope of danger or warning.

Please read this Manual carefully and keep it secure for easy reference at any time.

Safety of operator

When the robot operates automatically, it is first necessary to ensure the safety of the operator. It is quite dangerous to enter the motion range of the robot during its automatic operation. Measures should be taken to prevent the operator from entering the motion range of the robot.

General precautions are listed below. Please take appropriate measures to ensure the safety of the operator.

- 1. All operators using the robot system should pass the training courses provided by Agilebot Robotics Co., Ltd.
- 2. During the operation, it is possible that the robot is waiting for a start signal and is about to start even if it appears to have stopped. Even in such cases, it should be considered that the robot is in motion.
- 3. Make sure to set up safety fences and gates around the robot system.
- 4. Set peripheral devices outside the robot's range of motion as much as possible.
- 5. Arrange locks as needed to prevent personnel other than operators from turning on the power supply of the robot.
- 6. When conducting individual debugging of peripheral devices, it is important to disconnect the power supply of the robot in advance.
- 7. When handling or mounting the robot, make sure to follow the correct method shown by Agilebot Robotics Co., Ltd. The operation in the wrong way may lead to overturning of the robot, causing injury to the operator.
- 8. After mounting, make sure to operate the robot at a low speed for the first time. Then, gradually raise the speed and confirm if there are any abnormalities.
- 9. When using the robot for operation, it is important to confirm that there are no persons inside the safety fence in advance. Meanwhile, check for potential hazards and make sure to eliminate potential hazards (if any) before operation.
- 10. Do not operate the robot in the following situations. Otherwise, it may pose an adverse effect to the robot and also cause serious injuries to the operator.
 - 1) Flammable environments
 - 2) Explosive environments
 - 3) High-radiation environment
 - 4) Water or high humidity environment
 - 5) When connecting various stop signals of peripheral devices and the robot, make sure to confirm the stop operation to avoid incorrect connections.

Safety warning label

Both the robot and the controller bear several safety and information labels, which contain important information related to the product. This information is very useful for all persons operating the robot system, e.g. during mounting, maintenance or operation.

The safety labels are only graphical and applicable to all languages.

🛕 Caution

It is required to observe the safety and health signs on the product label. In addition, it is also necessary to comply with the supplementary safety information provided by the system builder or integrator.

Sign	Description
<u>A</u>	An electric shock may occur if the internally energized parts of the controller are touched when powered on.
	Operation against the instructions may result in an accident of personal injury or product damage. This is a warning message applicable to certain functional requirements.
	Grounding sign of controller
WARNING With a state of the servicing and waits minute, Failure to do so will result in serious injuries or death. Select suitable external protection device and withing Failure to do so will result in tripping: If select leakage current protection device, Recommend use delay type more than 30mA. Stop of the robot

The methods for stopping Agilebot robots include:

E-stop (equivalent to Class 0 stop of IEC 60204-1)

- Power off, namely disconnecting the servo power supply to stop the robot instantly.
- The robot is immediately braked and the servo power supply is disconnected as the same time. The robot stops immediately.

Protective stop (equivalent to Class 1 stop of IEC 60204-1)

- Controlled stop, namely the stopping method by disconnecting the servo power supply after the robot is decelerating.
- Control the robot to slow down and disconnect the servo power supply after 1s.

Warning

The stop distance and time of the controlled stop are longer than those of the uncontrolled stop. When the controlled stop is adopted, it is necessary to conduct a thorough risk assessment and analysis for the whole system for the stop distance and time are longer.

Strategies for e-stop and protective stop of the robot

The following three stop functions are specified according to GB 5226.1-2008.

Class 0: Stop (and uncontrolled stop) by simply cutting off the power of the mechanical braking mechanism.

Class 1: Controlled stop, namely apply a power to the mechanical braking mechanism to achieve the stop and remove the power after the stop.

Class 2: Controlled stop, namely applying stored kinetic energy to the mechanical actuator.

The protective stop of the Agilebot robot belongs to Class 1 stop mode.

The e-stop of the Agilebot robot belongs to Class 0 stop mode.

Please see the table below for details.

	E-stop	Protective stop
Occasion	There is a fast and accessible	It is determined by the rules of
	passage for the operator.	safety distance.
Start	Manual	Auto or manual
Performance of safety system	Class 3 in GB/T 16855.1-2008,	Class 3 in GB/T 16855.1-2008,
	or determined by risk	or determined by risk
	assessment	assessment
Reset	Only manual	Manual or auto
Operating frequency	Infrequent; it is used in	Variable; it is used in each cycle
	emergency situations.	or infrequently.
Function	Remove all hazardous energy	Control the protected danger.
	sources.	

Safety functions

Overview to safety functions

The Agilebot robot is provided with the following safety features:

- E-stop
- Enabling device
- External safety device connector
 - External e-stop button connector
 - External isolator connector
 - External limit/stop device connector

E-stop

The Agilebot robot is provided with the following emergency stop devices:

- > Emergency stop button on the upper right of the teach pendant
- > E-stop button on controller (only available on IRC-I8A-S controller)
- External e-stop device (input signal)

It is required to press this device in case of danger or emergency. The robot should have the following response when the emergency stop device is pressed:

The robot stops in the form of uncontrolled stop (Class 0).

First rotate the e-stop device for unlocking and then turn on the servo power to continue the operation.

🖺 Warning

If possibly causing a danger, the tools or other devices connected to the robot must be integrated into the e-stop circuit of the robot. Otherwise, it may cause death or serious bodily injury to the operator or damage to any property.

Enabling device

The enabling device of Agilebot robot is an enabling button located on the back of the teach pendant. It has three positions:

- Unpressed
- ➢ Middle
- Fully-pressed (alarm position)

The robot can be operated in the manual mode only when the enabling button is held in the middle position. During teaching operation of the robot or program operation under manual mode, the

release of the enabling button may trigger Class 1 stop mode; fully pressing of the enabling button may trigger a Class 0 stop mode.

External safety connector

1. External e-stop connector

Every workstation, which may control the start of a robot or trigger a hazardous situation, must be provided with an external e-stop device, which is under the responsibility of the system integrator. At least one external e-stop device must be mounted to ensure that an e-stop device is available even when the control TP is unplugged.

The external e-stop device is connected through a safety connector provided to the customer on the controller and is not included in the supply scope of industrial robots.

2. External isolator connector

The system integrator must use protective devices to prevent personnel from entering hazardous areas of industrial robots. This protective device is an isolator and must meet the following requirements:

- Comply with the requirements of EN ISO 14120.
- Can prevent personnel from entering dangerous areas or crossing it easily.
- Do not have or cause any danger.
- Must maintain a specified distance from all hazardous locations.

3. External limit/stop device connector

It is a device designed to prevent the robot from getting out of the working range. Do not have or cause any danger.

1 Product overview

This chapter provides an overview of basic composition and various devices of the Agilebot robot.

1.1 Robot system

The robot body is a mechanical body composed of such parts as motor, gearbox, encoder and drive mechanism.

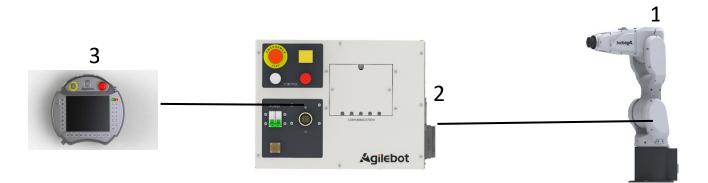

The Agilebot robot system is composed of:

- Robot body
- Controller
- Teach pendant
- Motor and encoder cables
- Software system

The Agilebot robot system is shown in the figure:

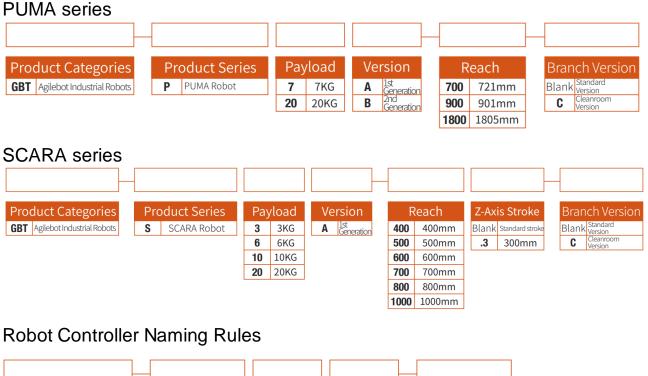

Robot body 2 - Controller 3 - Teach pendant
 Fig. 1.1 Composition of SCARA Robot

1- Robot body 2 - Controller 3 - Teach pendant Fig. 1.2 Composition of Six-axis Robot

1.2 Robot models

1.3 Controller

1.3.1 Teach pendant

The teach pendant is an operating device managing the interface between application software and the user. The teach pendant is connected to the controller through a cable. The appearance of the teach pendant is shown in Fig. 1.2.

Fig. 1.3 Front and Back of Teach Pendant

Caution

The USB port on the top of the teach pendant cannot be used for backup and restore. Please use the USB port on the controller.

The functions of buttons on the teach pendant are explained in the following table:

lcon	Function
	On/Off button of teach pendant: Press and hold this button to start the teach pendant after the controller is powered on. Release it when the orange lamp of the button is on. After the robot is started up, the On/Off button lamp changes from orange to green.
N L	Mode selector: Rotate the key to switch among Manual limit speed mode (L), Manual maximum speed mode (M) and Auto mode (A).
	E-stop button: used to brake the robot in emergency situations.
	Status lamps:
Fault Auto	• Fault status lamp: It is red when the robot has an alarm message and does not light up in case of no alarm.
Servo ON O	 Auto status lamp: It is green when the robot is in auto mode; otherwise it does not light up
	• Servo ON status lamp: It is green when the servo motor of the robot is powered on; otherwise it does not light up.

	 Running status lamp: It is green and flashes when the robot runs a program.
当前程序	Press this button to enter current program screen.
当前位置	Press this button to enter current position screen.
	Press this button to enter the I/O monitoring screen.
R	Press this button to enter the number register screen.
PR	Press this button to enter the pose register screen.
负载	Press this button to enter the payload setting screen.
首页	Press this button to return to the homepage of teach pendant.
	Start button: start and debug robot programs.
	Pause/stop button: pause program operation in execution status; stop program execution in the pause state.
$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	Jog key: It is used for jog feed; press the jog button to move the robot when there is no alarm, the enable device is kept at the middle gear and the mode selector is in manual mode.
Reset	Confirm the event or error and excite the robot.
Servo	Turn on the servo in auto mode.

Servo	Turn off the servo in auto mode.
V- V+	The Multiplier key is used to change the speed multiplier.
Enable device	It has three gears: Unpressed, Middle Holding and Fully-pressed and is used to excite the robot. Note: The servo motor of the robot is powered on in the Middle gear rather than Unpressed and Fully-pressed.

1.3.2 Controller panel

There are status lamps, controller switch, communication interfaces, etc. on the controller panel. See Fig. 1.4 and 1.5 for detailed instructions.

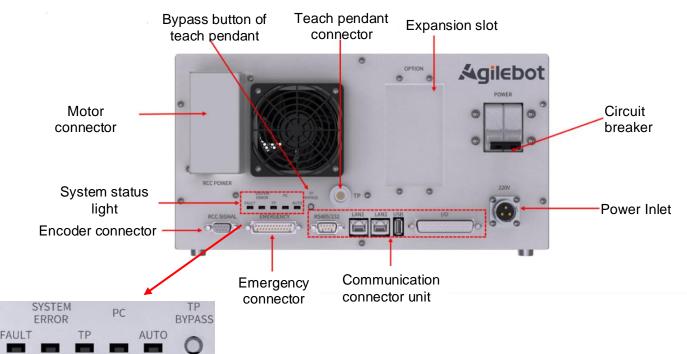

Fig. 1.4 Connectors on IRC-I4A-C Controller Panel

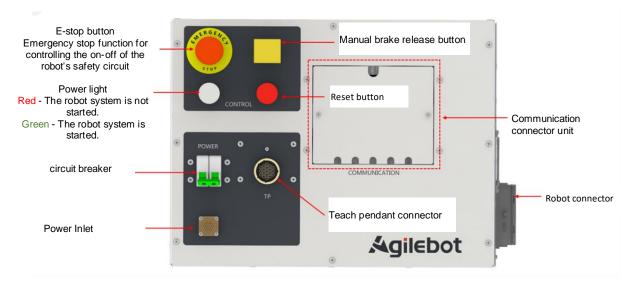

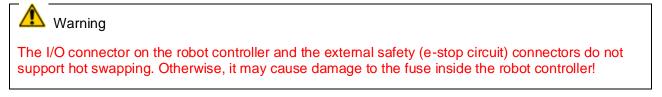

Fig. 1.5 Connectors on IRC-I8A-S Controller Panel

1.3.3 IRC-I4A-C controller without the teach pendant mode

IRC-I4A-C series controllers are not standardly provided with a teach pendant and can be operated by using the virtual teach pendant software "Compass". The system status lamps and TP BYPASS buttons in Fig. 1.4 are described in the table below:

System status lamp and button	Function
FAULT lamp	It is red when the robot reports an error and does
	not light up if it is normal.
SYSTEM ERROR lamp	The system error lamp lights up when a high-
	level error occurs, namely a serious error that
	cannot be cleared or reset by the rest button or
	rest signal (usually system level).
TP lamp	The light is in green when the controller is
	inserted into the teach pendant. Otherwise, it
	does not light up.
PC lamp	The light is in green when the virtual teach
	pendant software "Compass" is used for
	operation. Otherwise, it does not light up.
AUTO lamp	The light is in green when the operating mode of
	the robot is auto run. Otherwise, it does not light
	up.
TP BYPASS lamp	Press this button to switch the robot to the auto
	mode after the teach pendant is pulled out, if the
	robot is in the manual mode before the teach
	pendant is pulled out.

The teach pendants of IRC-I4A-C series controllers support hot swapping. When the teach pendant is pulled out, the Fault lamp is in red. The robot can be used normally by external reset or by resetting through virtual teach pendant software "Compass". If a teach pendant is inserted into the IRC-I4A-C series controller and it is desirous to operate the robot through Compass, it is required to switch the teach pendant to the auto mode so that Compass can be connected to the controller and have operation authorities; after Compass has the operation authority, the teach pendant loses the operation authority. At this time, the PC lamp is in green, while the TP lamp does not light up; if the teach pendant is in manual mode, Compass cannot be connected to the controller and the teach pendant has operation authority. If no teach pendant is inserted on the IRC-I4A-C series controller, it can be directly connected to the IRC-I4A-C series controller through Compass.

1.3.4 Communication

The controller has Internet interfaces for communication with peripheral devices. The IRC-I4A-C series controller has 2 Internet interfaces, while the IRC-I8A-S has 2 Internet interfaces and 2 backup ones. There is an internal switch enabling data exchange among Internet interfaces.

1.3.5 I/O signal

For I/O (I/O signals), universal and special signals can be used to enable the robot control system and external devices to transmit and receive data. The universal signals (user-defined signals) are controlled by programs and used for communication with external devices. The special signals (system-defined signals) are controlled by the system.

I/O can be divided into the following types.

- ➢ Digital I/O
- Special I/O
- Robot I/O

In order to facilitate I/O wiring, the controller is equipped with an external I/O adapter for customers.

1.3.6 Robot actions

For the action of the robot, the motion of the tool center point from the current position to the target position is regarded as an action instruction.

The robot controller uses the motion control system comprehensively controlling the trajectory, acceleration/deceleration, positioning and speed of the robot.

The robot controller can divide multiple axes into multiple action groups for control (multi-action function). The respective action groups are independent of each other, but can synchronously cause the robot to act simultaneously.

There are two types of robot actions: log feed from the teach pendant and action instruction based on the program.

- The action of the robot based on log feeding is executed through the buttons of the teach pendant. The action during jog feed is determined by the manual feed coordinate system and the speed.
- The action of the robot based on action instructions is determined by the position data, action type, positioning type, movement speed, speed multiplier and so forth specified in the action instruction.

The action types include "MOVEJ" (joint), "MOVEL" (straight), "MOVEC" (arc) and door type motion (see Section 3.3.1 for details), which can be selected to operate the robot. When "MOVEJ" is selected, the tool center point moves nonlinearly between two teach points. When "L is selected, the tool center point moves linearly between two teach points. When "MOVEC" is selected, the tool center point passes through the transition point from the starting point to the target point and its motion is controlled in an arc manner. There are two positioning types for the tool center point: "FINE" (positioning) and "SD" (corner radius).

1.3.7 E-stop devices

The robot is provided with the following e-stop devices:

- > E-stop button on the upper right of the teach pendant
- E-stop button on controller (available on IRC-I8A-S, IRC-I6A controller)
- External e-stop device (input signal)

The robot stops in any case when the e-stop button is pressed or an external e-stop signal is input.

1.4 Power-on/Power-off

This section mainly explains how to start/stop the robot control system.

1.4.1 Inspection before power-on

It is necessary to ensure mounting correctness to ensure the safety of the robot and the operator during operation. The following steps should be checked for the mounting of the robot:

- Mechanical inspection: Check whether the base is completely fixed and whether the endeffector is firmly mounted.
- > Wiring inspection: Check if the motor and encoder cables are wired correctly and firmly.
- Controller inspection: The controller (including power-off switch) should be mounted at a height convenient for operation and maintenance. The recommended mounting height is between 0.6m-1.9m.

1.4.2 Power-on

Power-on sequence: Connect the power cord of the controller and switch the circuit breaker to the Off state \rightarrow . Power on the controller, switch on the circuit breaker \rightarrow and press the Power-on button of the teach pendant. When the yellow lamp of the button is on, release \rightarrow and wait for startup. After normal startup and self-check, the screen shown in Fig. 1.6 is displayed.

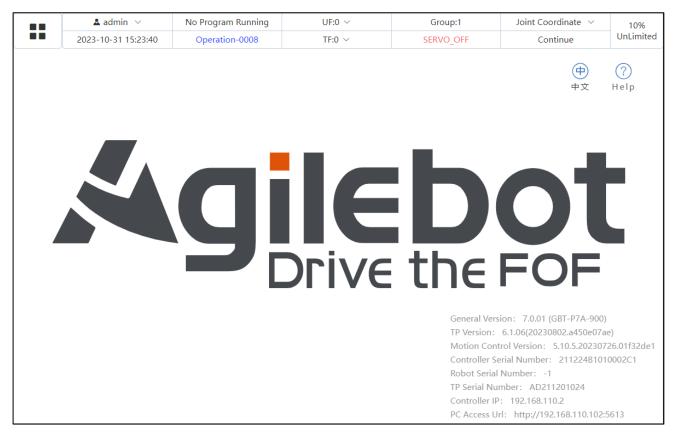

Fig. 1.6 Main Screen of Teach Pendant

1.4.3 Shutdown

Shutdown sequence:

1) Press the power switch button on TP until the screen shown in Fig. 1.7 appears, and then click Confirm.

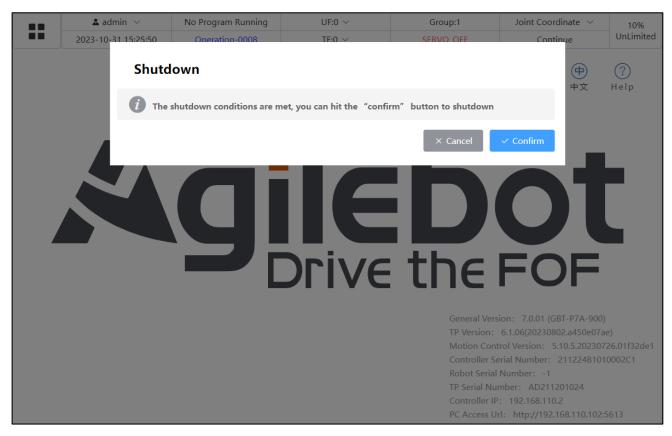

Fig. 1.7 Shutdown Window

2) When the AC-DC Power Supply lamp on TP changes from on to off, it indicates that TP has been turned down. At this time, disconnect the circuit breaker of the controller to complete the shutdown.

Power on only after the controller status lamp is completely off.

1.5 Introduction to operation interface

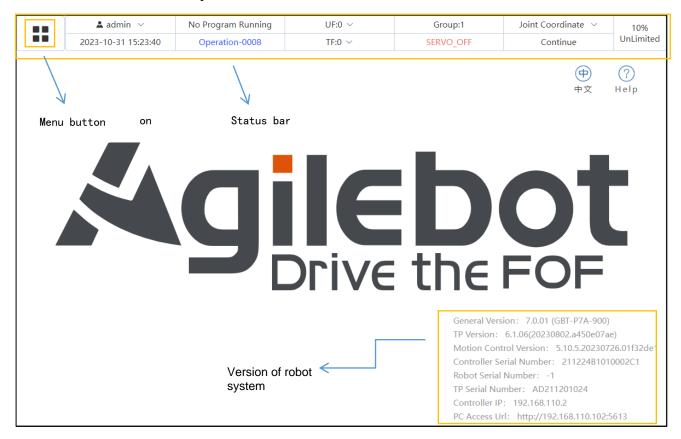

Fig. 1.8 Main Screen of Teach Pendant

1.5.1 Menu

Click the "Menu Button" in the upper left corner of Fig. 1.8 to pop up a menu list. The detailed menu list and sublist are as follows:

Fig. 1.12 Version of System Software

1.6 Mode selector

The mode selector is a key switch mounted on TP, as shown in Fig. 1.13. The mode selector is used to select the most suitable robot mode based on its action conditions and usage. There are three operation modes: M (Manual) - manual maximum speed mode, L (Limit manual) - manual limit speed mode and A (Auto) - auto mode.

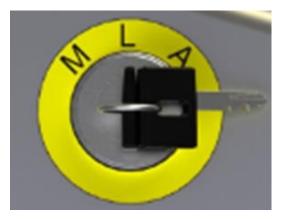

Fig. 1.13 Mode Selector

Switch the operation modes when no program is running. Remove the key from the switch to fix the switch in that position.

1. Manual maximum-speed mode (M)

This is a mode for robot program debuggers or operators (hereinafter referred to as the user) to debug the motions of the robot. In this mode, the user can mainly perform the following operations:

- Teach the robot.
- Debug executive programs, including positive-sequence continuous executive programs, positive-sequence single-step executive programs, and reverse-sequence single-step executive programs.
- Edit and modify robot programs.

In this mode, the user is mainly prohibited from performing the following operations.

• Start and execute robot programs through external signals.

2. Manual limit speed mode (L)

This is a manual mode where the robot has a limit speed, and its purpose is the same as the manual mode. However, it is only required to adjust and maintain the robot's motion speed below 250mm/s or 18.5°/s to prevent accidents caused by excessive speed during manual operation.

In this mode, the user can mainly perform the following operations:

- Teach the robot.
- Debug executive programs, including positive-sequence continuous executive programs, positive-sequence single-step executive programs, and reverse-sequence single-step executive programs.
- Edit and modify robot programs.

In this mode, the user is mainly prohibited from performing the following operations:

• Start and execute robot programs through external signals.

In this mode, the following restrictions are posed on the motion speed of the robot during program debugging or execution:

- The motion speed of the Cartesian motion instruction is always below 250mm/s.
- The motion speed of the joint instruction is always below 18.5°/s.
- The speed is limited based on the teaching speed at 100% magnification. Therefore, at a teaching speed of 2000mm/s, the speed is limited to 250mm/s if the magnification is 100% and to 125mm/s if the magnification is 50%. Thus, the speed can be further slowed down by lowering the magnification.

3. Auto mode (A)

This is the mode for automatic operation of the robot during normal operation. In this mode, the robot obtains the program information or program number to be executed through communication or I/O and then executes it.

In this mode, the user can mainly perform the following operations:

• Execute the robot program through the launch mode selected in the "Program Launch Mode".

In this mode, the user is mainly prohibited from performing the following operations.

- Teach the robot.
- Debug executive programs, including positive-sequence single-step executive programs and reverse-sequence single-step executive programs.
- Edit and modify robot programs.
- Modify relevant configurations of the robot.

1.7 Robot teaching

Teach the robot according to the joint coordinate system (please refer to 2.3 Coordinate System Settings for the contents of coordinate system).

The single axis operation of the robot is able to independently operate the robot arm to move in either the positive or negative direction of each axis. Specific operation process is as follows:

- 1. Turn the robot mode selector to L or M mode (manual mode).
- 2. In the TP status bar, select the reference coordinate system for robot operation as shown in Fig. 1.14.

Fig. 1.14 Reference Coordinate System

3. If the reference coordinate system for robot operation is a user or tool coordinate system (if not, ignore this step), it is also necessary to activate the user or tool coordinate system in the status bar. If the coordinate system is activated successfully, a prompt window pops up as shown in Fig. 1.16.

Fig. 1.16 Sign for Successful Activation of Coordinate System

4. Turn the Enable button on the back of TP to the middle gear, as shown in Fig. 1.15.

Fig. 1.17 TP Enable Button

- 5. Press the "Reset" button on TP to clear the alarm and observe if the status lamp "SERVO ON" turns green, indicating that the robot servo has been successfully powered on.
- 6. Press the Jog button to teach the robot movement, as shown in Fig. 1.18 below.

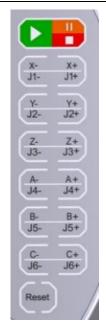

Fig. 1.18 Jog Button of Robot

\rm Caution

When teaching in the joint coordinate system, click the Jog button to control the rotation of each robot axis.

When teaching in the Cartesian coordinate system, jog Buttons X, Y and Z to control the tool coordinate origin of the robot to move along Axes X, Y and Z of the Cartesian coordinate system; jog Buttons A, B and C to control the tool coordinate origin to rotate around Axes X, Y and Z of the Cartesian coordinate system.

Teach the robot with world or base coordinate system.

The base coordinate system is located on the robot base and defined in the factory. The world coordinate system is defined at default to coincide with the base coordinate system. During teaching, the origin of the selected tool or flange coordinate system moves or rotates in the direction of the world or base coordinate system.

Teach the robot with user coordinate system.

During teaching, the origin of the selected tool or flange coordinate system moves or rotates in the direction of the user coordinate system.

Teach the robot with tool coordinate system.

During teaching, the selected tool coordinate system moves or rotates in the direction of the current tool coordinate system. The tool coordinate system spatially changes with its origin. Therefore, every teaching action may change the spatial position and pose of the origin or direction of the tool coordinate system.

Teach the robot with RTCP user/tool coordinate system.

Jogging under external TCP is similar to that in the user coordinate system. They move in X, Y and Z directions of the reference coordinate system. The difference between the jogging pose in external tool coordinate system and that in user coordinate system: for the jogging pose in the user coordinate system,

the TCP point rotates around the user coordinate system. for the jogging pose in the external tool coordinate system, the TCP point rotates around the external tool coordinate system.

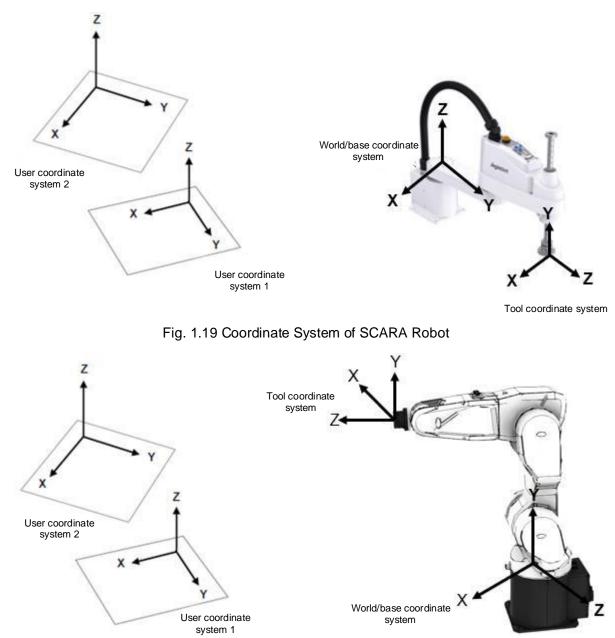

Fig. 1.20 Coordinate System of Six-axis Robot

1.8 Velocity control

Overall velocity control

The overall velocity control function is applicable to the following operation modes: manual limit speed mode, manual mode and auto mode.

After power-on, the overall velocity coefficient is always 10%, regardless of the position of the robot mode selector.

The user can manually input velocity values or pull the velocity slider to adjust the velocity.

- Under running instruction: velocity limit of the robot = instruction velocity * overall velocity coefficient % (maximum speed is 250mm/s or 18.5 °/s in manual limit speed mode)
- During teaching: velocity limit of the robot = 250mm/s * overall velocity coefficient % or 18.5 °/s * overall velocity coefficient %

When the robot is in motion, the adjusted overall velocity takes effect when the next motion instruction is parsed and executed.

Step teaching (using feed rate)

The step teaching function is applicable to: manual (limit speed) mode and manual maximum speed mode. The feeding motion control function is not available in the automatic mode. The overall velocity becomes 10% whenever the operation mode is switched to the auto mode.

After the step teaching function is enabled, the robot only moves at the feed rate of the corresponding step size each time the robot movement button is pressed. The feed rate is divided into two levels: 0.05mm and 1mm (the corresponding joint-coordinate motion step and pose-angle rotation step are tentatively set at 0.5° and 2°). If switching to the auto mode, the user is not allowed to click this button.

Note: When the step motion is planned, the given speed limit is fixed at 250mm/s.

Velocity 1%	-	10%	30%		70%			×
Velocity	•						10	%
0.1%	5%	20%		50%		100%		
Step 🗸 Open	1.0mm/2.0°	0.05mm/0.5°						

Fig. 1.21 Speed Setting Window

2 Setting of robot system

2.1 I/0 signal

I/O (I/O signal) is an electrical signal used by the robot to communicate with peripheral devices, e.g. endeffector and external devices. It consists of universal I/O and special I/O.

Universal I/O

Digital I/O D I[i]/DO[i]

[i] of I/O represents the logical number of the signal number.

Special I/O

The special I/O is an I/O whose purpose has been determined.

System I/O U I[i]/UO[i]

[i] of I/O represents the logical number of the signal number.

Robot I/O

The robot I/O represents the I/O interfaces on the PUMA robot; The SCARA robot does not have this signal interface.

Robot I/O RI[i]/RO[i]

[i] of I/O represents the logical number of the signal number.

I/O mapping

The universal I/O (DI/O) and special I/O (UI/O, etc.) are referred to as logical signals.

In contrast, the actual I/O signal points are referred to as physical signals. To specify physical signals, use the I/O mapping function to specify the I/O module and use the signal number (physical number) within the I/O module to specify each signal.

Physical number

The physical number refers to the signal number in the I/O module. Express the physical number as follows.

- Digital input signal: Input Port1, Input Port2...
- Digital output signal: Output Port1, Output Port2...

It is required to establish an association between physical signals and logical signals in order to control the I/O signal points on the robot controller. This association is called I/O mapping (configuration).

• For digital I/O and system I/O, the I/O allocation can be changed and the association between physical and logical signals can be redefined.

DI/DO adapter

An I/O adapter is provided to facilitate the wiring and use of I/O signals.

The wiring method of the IRC-I4A-C controller adapter should be suitable for the type of controller. The NPN controller adapter should be wired according to the NPN method, while the PNP controller adapter according to the PNP method. The IRC-I4A-C controller has the control ports of 16 outputs and 24 inputs;

it is connected to the adapter with a special signal cable. The appearance of IRC-I4A-C adapter is shown in the following figure.

Fig. 2.1 External I/O Board

The following table provides a detailed explanation of the default wire sequence definitions for each port on the I/O board: (actual functions can be set according to the operating scenario).

The adapter for the IRC-I8A-S controller should be wired in PNP mode. This controller has the control ports of 25 outputs and 25 inputs; it is connected to the adapter with a special signal cable. End A of the adapter is the input end with 25 input ports; End B is the output end with 25 output ports. The appearance of IRC-I8A-S controller adapter is shown in the following figure.

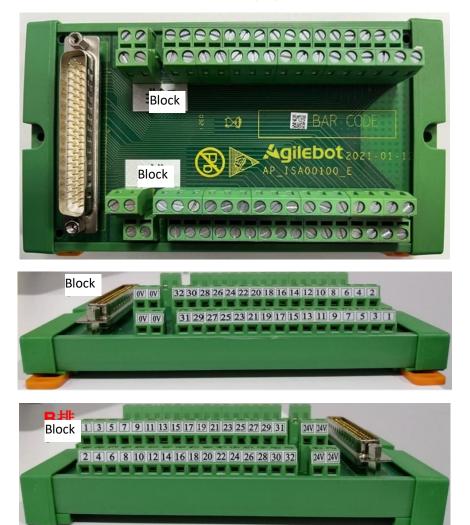

Fig. 2.2 External I/O Board

The following table provides a detailed explanation of the default wire sequence definitions for each port on the I/O board: (actual functions can be set according to the operating scenario).

Port No. of terminal	Functional/physical	Default setting	Signal description

2.1.1 Digital I/O

Digital I/O (DI/DO) is a standard digital signal for data exchange from peripheral devices by processing input/output signal lines of the I/O units. To put it correctly, it belongs to a universal digital signal. There are two digital signal values: ON and OFF.

I/O mapping (configuration)

Digital I/O can redefine the physical numbers of signal lines and set the following items. For details on I/O allocation, please refer to "2.1 I/O Signals".

The starting port assigns physical numbers to logical numbers to achieve signal point mapping. Thus, the initial physical number can be specified for the allocation.

🔨 Caution

The physical number specifies the input/output pins on the I/O module. The logical number is assigned to the physical number. So, a signal can be regarded as a unit to change the allocation.

The starting port of the physical number is set according to actual needs.

Allocation of digital I/O

Successively click "Menu Button" \rightarrow "Communication" \rightarrow "I/O Mapping" to enter the screen as shown in Fig. 2.3.

Fig. 2.3 I/O Mapping Interface

Specific meanings of the I/O mapping interface are as follows:

- I/O type: The user can choose it according to the I/O type to be managed and mapped. Currently, the mappable I/O includes DI/DO/UI/UO;
- Input: Display UO/DO or UI/DI (DI in the diagram) according to the "I/O Type" selected by the user. Choose the logical signal ID for I/O mapping here; (method: Set the entire segment, namely, simply input start and end IDs of the logical I/O to be set. For example, in order to set 12 DIs, simply enter 1 at the position of start ID and 12 at the position of end ID.) (Note: The ID segments of the same I/O type cannot overlap.)
- Module number: It allows the user to select the communication module recognized in the current system, as shown in the figure below:

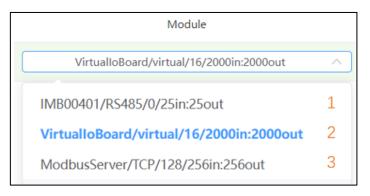

Fig. 2.4 Module Selection Interface

- Module 1 is the I/O adapter of the controller used by a six-axis robot. For the SCARA robot, the module name changes from IMB00401/RS485/0/25in:25out to embedediMB/AXI/024in:16out.
- Module 2 is a virtual device I/O for the user to perform I/O mapping without actual physical I/O modules to facilitate program debugging.
- Module 3 is a modbus tcp module, which can map logical signals to the modbus register; e.g. Mapping DI to Coil Status and DO to Discrete inputs in the modbus register.

Caution

In the module number drop-down list, only communication modules and Virtual I/O Devices recognized in the current system are available for the user to choose. Virtual I/O Device is a virtual I/O device (2000 In/2000 Out) for the user to perform I/O mapping without actual physical I/O modules to facilitate program debugging.

- Start Port: It is the physical port, on the I/O module, corresponding to the first logical I/O of the input logical I/O segment to be configured. Example: The required I/O segment is DI1-DI5. If the user chooses the corresponding physical port as 3, the relationship is that DI1-DI5 correspond to physical ports "Input Port3-Input Port7" one-to-one. Namely, if the physical port "Input Port3" has a signal input, the DI1 status is ON; so do the states of DI2-DI5.
- Total number: It is the number of I/O automatically calculated based on start and end IDs (number = end number - start number + 1); (for example, DI2-DI5 corresponding to the I/O number of 5-2+1=4). It is read only and cannot be operated by the user.

- Status: Display the status of each entry in the I/O mapping; there are four types: Active, Unfindable, Modifying and Invalid.
 - Active means that the I/O configuration is in an active state (successfully configured and saved).
 - Unfindable indicates that the physical module cannot be found (this situation specifically refers to the original active state caused by the disconnection of the physical module).
 - Modifying/To be Saved represents the modified I/O configuration, which is legal but has not been saved yet.
 - Invalid indicates that the configured content of the entry is invalid and contains missing items (illegal) of errors or address conflicts. The user cannot successfully save it (other entries in the Modifying/To be Saved state can be saved).
- > Add: Click this button to create a new I/O configuration entry.
- Save: Click to save the mapped content.
- > Delete: Click to delete the currently-selected I/O configuration entry.
- > Display error: Display current error and make modifications according to its prompt content.
- > I/O status: Click here to switch to the I/O status interface

Output

Set the output value of the robot through program execution or manual operation.

See Section 2.2 for forced output and simulated input of signals.

\land Warning

The controller controls peripheral devices through signals. Forced output/simulated input may pose adverse effects on the safety of the system in some cases. Never perform forced output or simulated input before confirming the usage and function of the signal.

2.1.2 Special I/O

System I/O (UI/UO) is a special signal whose purpose has been determined in the system, namely system I/O signal. These signals are connected from the I/O module to the remote controller and peripheral devices and the robot is controlled externally. Refer to Section 2.1.1 for mapping contents of special I/O.

The special I/O, namely system I/O, is described in the following:

List of UI/UO signals

	Servo_Ena		I			
UI[1]	ble Servo enable signal (it can be used as an alarm signal of instantaneo us stop peripheral software; or after pausing, it turns off the servo- holding brake to make a complete stop)	Servo_Enable is usually ON. When the peripheral upper computer does not want the robot to move or when power is switched on, it is switched to OFF. It is used for safety locking. In the OFF state, the system performs the following processing: 1. Issue an alarm and then disconnect the servo power supply. 2. Instantly stop the robot (Class 0 stop) and suspend the execution of the program. 3. The servo cannot always be enabled. The bypass is ON.		UO[1]	CMDENB LE Allow peripheral devices to control the status signals of the robot.	ON indicates that peripheral device control is enabled, while OFF means that peripheral device control is disabled. Output high level when the following conditions are met: 1. UI[5] is ON. 2. The mode selector is in "Auto" mode. 3. UO[3] is OFF.
UI[2]	Pause_Req uest	Pause signal. It is usually ON. In the OFF state, the system performs the following processing: It is planned to slow down and stop the executing action and to suspend the execution of the program. The bypass is ON.		UO[2]	Paused	"Paused" status signal. When the program execution status is "Paused", this signal is ON (i.e. the robot is paused).
UI[3]	Reset Alarm reset signal	Release the alarm, power on the servo and effectively generate a Reset request at a high level.		UO[3]	FAULT	When an alarm occurs in the system, this alarm signal is output and can be reset by RESET. Note: This signal is not output when the system issues a warning type alarm.
UI[4]	Start & Restart Program Iaunch/resu me signal	Start or restart the program (depending on whether the program status is "Aborted" or "Pause") and its function is the same as the Start button on TP. Take the effective falling edge to start or restart the program.		UO[4]	Program Running Program running signal	ON indicates that the program is running; OFF indicates that no program is running.

UI[5]	Abort Program Program abort signal	Request to terminate a program in execution or paused state. It is usually ON. In the OFF state, the system performs the following processing: 1) The alarm bar indicates a program abort request and the program enters the abort mode. If the program is still running, immediately stop the robot's action and then abort the program. It is similar to an "aborted" alarm. 2) Allow to enable and teach the servo, but not to manually or automatically execute programs. The bypass is ON.	UO[5]	Servo Status	This signal is set to high level when the robot operation status is "Working", "On Standby" or "Servo ON". It is at lower level under "Servo-OFF".
UI[6]	Selection Strobe Trigger signal	It is only valid when the "Program Launch Mode" is set to "MPLCS" or "MPLCS Simple Trigger". Read the trigger signal for selecting the program to be executed. When it is ON, read the input of Program Selection 1-6 and select the program to be executed. Note: This signal is ignored when a program is executing (running or paused).	UO[6]	Selection Check Request	It is only valid when the "Program Launch Mode" is set to "MPLCS" or "MPLCS Simple Trigger".
UI[7]	MPLCS Start	It is only valid when the "Program Launch Mode" is set to "MPLCS" or "MPLCS Simple Trigger". It is a start signal of program number selection.	UO[7]	MPLCS Start Done	It is only valid when the "Program Launch Mode" is set to "MPLCS" or "MPLCS Simple Trigger".
UI[8]- UI[13]	Program Selection 1- 6	It is only valid when the "Program Launch Mode" is set to "MPLCS" or "MPLCS Simple Trigger". The 6-digit binary number of the program number is converted to a decimal number, which is the start number of the main program to be executed.	UO[8]- UO[13]	Selection Confirm 1-6	It is only valid when the "Program Launch Mode" is set to "MPLCS" or "MPLCS Simple Trigger". After receiving the Selection Strobe signal, the robot controller may read the status of UI[8]-UI[13] and feed it back to the

Operation Manual for Robot System

	upper computer for confirmation.
--	----------------------------------

2.1.3 Robot I/O

Robot I/O is a digital signal used as end-effector I/O by the robot. The end-effector I/O is used after being connected to the connector attached to the robot's wrist.

The end-effector I/O (I/O interface on robot body) consists of the universal signals of 6 inputs and 6 outputs.

RI [1~6] input

RO [1~6] output

The I/O interfaces on the body is on four axis arms, with two interfaces, EE1 and EE2.

\land Caution

There is no I/O interface on the body of SCARA robot. Namely, the SCARA robot does not have ${\sf RO}/{\sf I}.$

2.2 Manual control of I/O

The manual control of I/O involves signal interaction with peripheral devices before executing the program.

The manual control of I/O refers to the following entries.

- Forced output
- Simulated input

Successively click "Menu Button" \rightarrow "Communication" \rightarrow "I/O Status" to enter the I/O status screen as shown in the following figure.

	🚨 admin 🗸	No Program Running	UF:	0 ~	Group:1	Joint Coordinate	10%

Operation Manual for Robot System

Fig. 2.9 System Signal Window

2.3 Setting of coordinate system

The coordinate system is a position indicator system defined on the robot or space to determine the position and pose of the robot. The robot has multiple coordinate systems as follows.

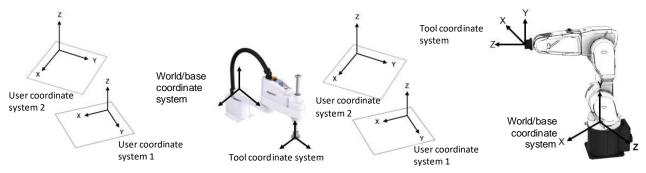

Fig. 2.10 Coordinate Systems of Robots

Joint coordinate system

The joint coordinate system is set in the joints of the robot. In the joint coordinate system, the positions and poses of the robot are determined based on the joint coordinate system on the base side of each joint.

Cartesian coordinate system

In the Cartesian coordinate system, the positions and poses of the robot are defined by the coordinates X, Y and Z from the origin in space to the origin (tool center point) on the tool side, as well as the rotation angles A, B and C relative to the tool side around the X, Y and Z axes in space.

Tool coordinate system

This is the coordinate system defining the position of the tool center point (TCP) and the tool pose. The tool coordinate system must be defined in advance. When not, the default is the end flange coordinate system.

World coordinate system

It is the standard Cartesian coordinate system fixed in space and coinciding with the base coordinate system.

Base coordinate system

It is the standard Cartesian coordinate system fixed to the base of the robot and the user coordinate system is defined accordingly.

User coordinate system

The user coordinate system is a Cartesian coordinate system defined by the user for each workspace. If not, it is replaced by the world/base coordinate system.

2.3.1 Setting of tool coordinate system

The tool coordinate system is a Cartesian coordinate system defining the tool center point (TCP) and the tool pose. In the tool coordinate system, TCP is usually taken as the origin and the tool direction as Axis Z.

The tool coordinate system is composed of the position of the tool center point (TCP) (X, Y, Z) and the tool pose (A, B, C).

The position of the tool center point (TCP) is defined by coordinates x, y and z relative to the default coordinate system of the tool center point.

The tool pose is defined by the pose of the tool coordinate system relative to the end flange coordinate system.

The tool coordinate system is defined on the coordinate system setting screen. It is allowed to define 10 tool coordinate systems, which can be switched according to the situation.

Advantages of tool coordinate system:

- > It can allow the tool to move linearly in the direction of the tool coordinate system.
- The tool can rotate around the tool coordinate system, the position of the tool's working point is kept unchanged while the direction is changing, so that the robot pose is changing accordingly.
- The velocity set by the program is the actual velocity of the tool working point rather than the default velocity at the end of the flange.
- > The default tool coordinate system is the end flange coordinate system.

Setting method

- ➢ 4P method
- > 7P method (only applicable to PUMA robots)
- Direct write method

L Caution

Before setting the tool coordinate system, it is required to switch the current coordinate system to the base coordinate system and teach the poses under the base coordinate system.

Introduction to tool coordinate system interface

	Tool Coordinate								User (Coordinate	
ID 1			Group	Group ID 1 V Name			Name	111

* A	0.000)	0	* B	0.000		0	* C	0.000	o	

Fig. 2.11 Tool Coordinate System Setting Window

- > User coordinate system: Click it to switch to the user coordinate system setting interface.
- > ID: number of the currently selected tool coordinate system
- Group ID: motion group, currently supporting the robot body, with the body Group ID represented by 1.
- > Name: It is allowed to enter the name of tool coordinate system.
- > Note: Notes can be made for the tool coordinate system.

7P setting of tool coordinate system for PUMA robot

The 7P method is adopted to set the tool coordinate poses as shown in Fig. 2.12. The control poses P1-P5 should always contact with the sharp points of the calibrator and the poses of P1-P4 should be as different as possible. When teaching P5, the end of the tool must be linear with the calibrator. P6 is used to determine the direction of tool coordinate X and P7 to determine the direction of tool coordinate Z. During teaching, P7 can move a distance towards tool coordinate Z based on P6.

Operation Manual for Robot System

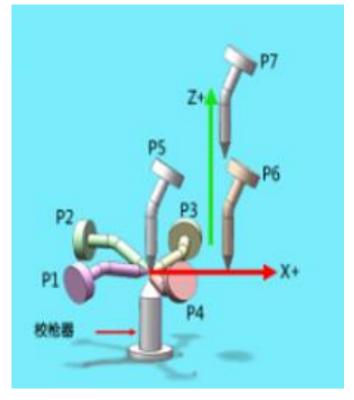

Fig. 2.12 7P Setting of Tool Coordinate Poses

Specific steps:

1. Click "Menu Button" → "Coordinate System" → "Tool Coordinate System" to enter the tool coordinate system setting interface, as shown in Fig. 2.13.

2.3.2 Setting of user coordinate system

The user coordinate system is a Cartesian coordinate system defined based on the user's workspace.

When not defined, the user coordinate system is replaced by the world coordinate system.

The user coordinate system is defined by the position of the origin relative to the base coordinate system (X, Y, Z) and the rotation angles around X, Y, and Z axes (A, B, C).

The user coordinate system is used when setting and executing pose registers and executing position compensation instructions. In addition, the position in the program can also be taught based on user coordinates. For setting of the position register, please refer to Section 5.1.3. For execution of position compensation instructions, refer to 3.3.5 Additional Action Instructions.

Caution

In the case of teaching in joint form, changing the user coordinate system may not affect the position variables and position registers. However, please note that position variables and position registers are affected by the user coordinate system in the case of teaching in Cartesian form.

When the user coordinate system is defined on the coordinate system setting screen, 10 coordinate systems can be defined and switched according to the situation.

Advantages of user coordinate system:

- > Manually move the tool coordinate system along the edge of the working surface or workpiece.
- Perform pose teaching with the user's base coordinates as references. If the workpiece must be moved for its fixture has been moved (for example), it is required to simply reset the user coordinate system to the same position on the fixture and not to teach the program points again.
- > The default user coordinate system coincides with the base coordinate system.

The data format of the user coordinate system is: [X 0mm, Y 0mm, Z 0mm, A 0°, B 0°, C 0°].

Setting method:

1. 3P method

As shown in Fig. 2.24, the first point "X Start" is the starting point of the X-axis; the second teaching point "X Direction" is a point in the X-axis direction; the third teaching point "Y Direction" is a point in the Y-axis direction. After clicking "Save", the system may automatically calculate XYZABC parameters related to the user coordinate system.

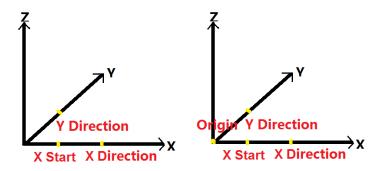

Fig. 2.24 3P Method Fig. 2.25 4P Method

2. 4P method

As shown in Fig. 2.25, the first point "X Start" is the starting point of the X-axis; the second teaching point "X Direction" is a point in the X-axis direction; the third teaching point "Y Direction" is a point in the Y-axis direction; the fourth point "Coord Origin" is the origin position of the user coordinate system (which can be any point in space). After clicking "Save", the system may automatically calculate XYZABC parameters related to the user coordinate system.

3. Direct write method

Steps of 3P/4P method:

1) Click "Menu Button" \rightarrow "Coordinate System" \rightarrow "User Coordinate System" to enter the interface as shown in Fig. 2.26, and Choose 3p/4p as shown in the figure below.

2.3.3 Setting of Remote TCP

Overview to remote TCP:

The remote TCP function can be adopted to move the workpiece fixed on the robot relative to the TCP fixed on the ground (i.e. remote TCP), so that the workpiece can perform linear, arc and other actions relative to the tool fixed on the ground so as to complete machining.

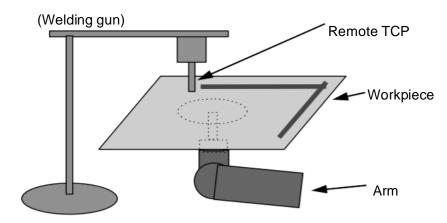

Fig. 2.30 Design Diagram of Remote TCP

To use the remote TCP function, it is necessary to teach the robot for protruding positions relative to the tool fixed on the ground.

The setting method of the RTCP coordinate system is consistent with that of the user coordinate system, of which the direct write method/3P method/4P method can be adopted and the RTCP coordinate system can be set directly in the configuration page of the user coordinate system.

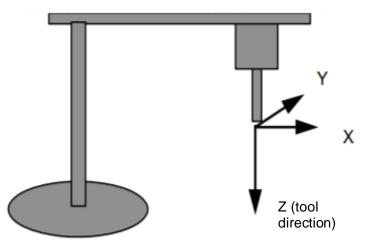

Fig. 2.31 Schematic Diagram of Remote TCP Coordinate System

When performing jogging teach based on the RTCP coordinate system, namely parallel movement/rotation around the remote TCP, it is necessary to select "RTCP/Tool" or "RTCP/User" from the coordinate system drop-down menu in the page status bar and choose corresponding user and tool coordinate systems.

Fig. 2.32 Reference Coordinate System Menu

The characteristics and differences between "RTCP/Tool" and "RTCP/User":

Coordinate system	Center point	Equal movement/rotation direction
RTCP/tool	RTCP	Selected tool coordinate system
Tool coordinate system	TCP	Selected tool coordinate system
RTCP/user	RTCP	Selected user coordinate
		system

Fig. 2.33 References of Remote TCP Movement Directions

When executing remote TCP actions, it is necessary to add an additional instruction RTCP of remote tool action in the instructions. When the RTCP additional instruction is used as the motion instruction, the user coordinate system adopted for pose recording may become the RTCP coordinate system. In case of no RTCP additional instruction, it still maintains the user coordinate system.

L Caution

RTCP cannot be used during joint movement.

Example:

Relative to remote TCP, move the workpiece to P[1] at a relative velocity of 2000mm/s:

MoveL P[1] 2000mm/s Fine RTCP

Relative to remote TCP, move the workpiece from P[1] to P[2] at a relative velocity of 2000mm/s:

MoveC P[1] P[2] 2000mm/s Fine RTCP

2.3.4 Coordinate transformation function

Overview to coordinate system transformation:

The coordinate transformation function is as follows: select the instruction in a certain range in the program, convert the tool or user coordinate system used in the pose data according to the motion statement of the recorded pose data and then use the transformed program statement as a new program or segment. Before transformation, different transformation rules can be selected to change or maintain coordinate values in the pose data, so that the robot can move to a new actual position based on the new coordinate system and the actual position of the robot can also be kept consistent with that before transformation. Namely, the angles of each joint remain unchanged.

Application scenario:

Arm A previously used is damaged and should be replaced with Arm B. However, Arm B is 1cm shorter than Arm A. In this case, the tool coordinate system of Arm B can be established first. Then, the tool coordinate transformation rules can be configured and executed. Finally, the robot can also reach the position reachable by Arm A when executing the transformed program.

When it is necessary to copy the working surface and its trajectory, a user coordinate system can be established based on the new working position. Then, the user coordinate transformation rules can be configured and executed. Finally, when the robot executes the transformed program, its relative trajectory in the new user coordinate system can be kept consistent with that in the original working surface.

Setting of coordinate system transformation:

1) Click "Menu Button" → "Application" → "Coordinate Transformation" to enter the coordinate transformation interface, as shown in Fig. 2.34.

 🚨 admin 🗸	No Program Running		UF:0 ∨	Grou	ıp:1	Base Coordinate	e 🗸	10%

Source TF No.	Select	~	Target	TF No.	Select		~	
					Do Tra	nsformation	Rese	et Form

Fig. 2.34 Coordinate Transformation Interface

Description of coordinate transformation parameters:

- Source Program: A program requiring coordinate transformation
- Target Program: Name the new program after transformation here or use the original program name.
- Transform Scope: Choose All to transform the whole program or Local to transform the specified program scope.
- > Program Scope: Used in conjunction with transform scope.
- > Target Line: Insert the line of the target program.
- > Transform Target: There are two types: user coordinate system and tool coordinate system.
- Transform Rule: If the transform target is the user coordinate system, there are two transform rules: Pose Data Fixed and Pose Data Changed.
 - If the transform target is a tool coordinate system, the transform rules are TCP Fixed and Robot Fixed.
 - For specific transform rules, see the detailed description of transform rules in the following text.
- Number of tool/user coordinate system before transform: The number of the tool/user coordinate system used for the pose in the original program.
- Number of tool/user coordinate system after transform: The number of the tool/user coordinate system to be used in the target program.
- 2) After setting of the above parameters, click "Do Transformation", and the following pop-up window will appear.

Fig. 2.35 Transformation Completion Window

3) Click "Save" to complete the transformation.

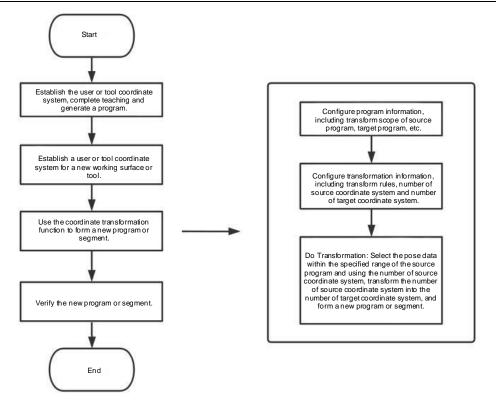

Fig. 2.36 Coordinate Transformation Flowchart

Caution

Position and pose values in pose data:

Only perform offset calculation for P[] in the program, while the pose register PR[] remains unchanged and does not involve in offset calculation.

After offset calculation, the pose P[] expressed based on the Cartesian coordinate system is still a Cartesian coordinate value and the pose P[] expressed based on the joint coordinate system is still a joint coordinate value.

When the P[] after offset calculation falls outside the motion space, it is saved as an untaught value if the P[] is expressed based on the joint coordinate system; the offset value is directly saved if the P[] is expressed in a Cartesian coordinate system.

Transformation rules in tool coordinate transformation:

- TCP Fixed: Before and after transformation, the "Tool coordinate system number after transformation" directly replaces the "Tool coordinate system number before transformation" and the pose coordinate value remains unchanged in the pose data. Typical application scenario: It is used to replace damaged tools. This rule can ensure that the new tool can still reach the working position of the original tool when the transformed program is executed.
- Robot Fixed: Before and after transformation, the "Tool coordinate system number after transformation" directly replaces the "Tool coordinate system number before transformation" in the pose data. However, the pose coordinate values are recalculated and generated and their calculation rule is that the joint angle of the robot remains unchanged relative to the original pose. Typical application scenario: It mainly lets the robot to avoid certain path positions, but does not care about the position of TCP.

Operation Manual for Robot System

Transformation rules in user coordinate transformation:

- Pose Data Fixed: Before and after transformation, the "User coordinate system number after transformation" directly replaces the "User coordinate system number before transformation" and the pose coordinate value remains unchanged in the pose data. Typical application scenario: When the original working surface is displaced or a working surface should be copied, a new user coordinate system can be established based on the changed working surface (a user coordinate system has already been established based on the original working surface). Then, the rule is used to execute the user coordinate transformation. Finally, when the robot executes the transformed program, it can ensure that the path of the robot remains unchanged relative to the new working surface.
- Pose Data Changed: Before and after transformation, the "User coordinate system number after transformation" directly replaces the "User coordinate system number before transformation" in the pose data. However, the pose coordinate values are recalculated and generated and their calculation rule is that the joint angle of the robot remains unchanged relative to the original pose. Typical application scenario: Actual position of the target workpiece has not changed, but the benchmark for the workpiece has changed.

2.4 Soft limit

The software limits and protects the reach of each axis joint of the robot, so that its software protection range is smaller than the hard limit of the model at default so as to avoid frequent hard collisions during normal operation.

The user is allowed to set the joint range of the soft limit according to the situation (but it is always smaller than the mechanical hard limit range of the model).

1. Never rely solely on the movable range of the joint to control the motion reach of the robot. The limit switch and hard limit should be used simultaneously. Otherwise, it may cause personal injury or equipment damage.

Please adjust the hard limit to meet software adjustment. Otherwise, it may cause personal injury or equipment damage.

The change in the movable range of the joint has an impact on the motion reach of the robot. To avoid malfunctions, it is necessary to reconsider the impact of changing the movable range of each axis. If the change of the movable range is not considered sufficiently, it may lead to unexpected results, e.g. alarm at the previously taught position.

Upper limit:

It indicates the upper limit value of the joint's movable range. It is the movable range in the positive direction.

Lower limit:

It indicates the lower limit value of the joint's movable range. It is the movable range in the negative direction.

Function description:

The joint range of the soft limit can be set through the TP application end. The setting method is to modify it in the input box with an accuracy of 0.001°. Null values and characters are prohibited. It is not allowed to fill in a soft limit range value exceeding the factory default range (the default range is displayed in the soft limit setting interface).

2.4.1 Soft limit interface

Steps for setting soft limit of the joint:

Successively click "Menu Button" \rightarrow "System" \rightarrow "Basic Setting" \rightarrow "Soft Limit Setting" to enter the screen as shown in Fig. 2.37.

										🖉 Edit

Fig. 2.37 Soft limit Setting interface

Through this interface, the user can set the soft limit of the robot. However, the soft limit set by the user must be less than or equal to the default soft limit set at the factory.

- > Axis: It indicates the information of all axes under the motion group.
- Soft Lower: It is the lower axis limit. It is not necessarily a negative number, but must be less than or equal to the positive limit.
- Soft Upper: It is the upper axis limit. It is not necessarily a positive number, but must be greater or equal to the negative limit.

L Caution

Click "Edit" to modify upper and lower limits of the soft limit. In the input box of positive and negative limits, the system may automatically change to the upper limit of the positive limit specified at the factory if the user fills in a value greater than the specified positive limit at the factory; the system may automatically change to the lower limit of the negative limit specified at the factory if the user fills in a value greater than the specified positive limit at the factory; the system may automatically change to the lower limit of the negative limit specified at the factory if the user fills in a value less than the specified negative limit. After change, click "Save" to make it effective immediately.

2.5 Payload setting

Summary of payload setting:

The payload setting is to set relevant information of the payload (weight, barycenter, etc.) mounted on the robot.

The following effects can be achieved by setting payload information appropriately.

- > Improve motion performances (lower vibration, better cycle time, higher accuracy, etc.).
- Effectively utilize relevant dynamic functions. (Improve the collision detection function, gravity compensation function and other properties.)

If a greater error is found in payload information, it may lead to great vibration or incorrect detection of collisions. In order to more effectively use the robot, the user is recommended to appropriately set payload information of the devices arranged on robots, workpieces or arms.

The payload information can be set on the "Payload Setting Screen". 10 payloads can be set on this screen. Multiple payloads can be set in advance. Then, the payloads can be changed by simply switching their numbers. In addition, the payload number can be switched in the program through program instructions (see Section 3.8.5).

The robot can achieve optimal control accuracy and stability under corresponding payloads by selecting or adjusting internal control parameters for different payloads.

The payload is set in the following steps:

Successively click "Menu Button" → "System Setting" → "Basic Setting" → "Payload Setting" to enter the screen as shown in Fig. 2.38. The payload activated at default is set to [Payload: 0] and cannot be edited.

		Barycenter		Moment	Moment of inertia			
		x 0	mm	lx	0	رg.m²		
		у 0	mm	ly	0	رg.m²		

Fig. 2.39 Payload Parameter Interface

Among others, M (kg) is the mass of the payload, X (mm), Y (mm) and Z (mm) are the barycenter positions of the payload relative to the flange center as shown in Fig. 2.39, and Ix, Iy and Iz are the rotational inertia of the payload relative to X, Y and Z coordinates. When the payload of the robot is taken as a mass point, the moment of inertia lx, ly and lz are written as 0.

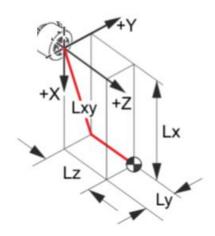

Fig. 2.40 Payload Position Reference

3. The setting of activated payload is shown in Fig. 2.40, with a " $\sqrt{}$ " mark in front of the activated load.

2.6 Zero calibration

Zero calibration is an operation associating the angle of each robot joint with the pulse count.

The zero calibration operation is to obtain the pulse count corresponding to the zero-point position.

The "zero calibration" is completed before ex-factory. It is unnecessary to perform zero calibration in daily operations. However, zero calibration should be performed in the following situations.

Please contact us for performing high-precision calibration in the following situations: the motor, pulse encoder or reducer is replaced, or the battery used for pulse count backup is depleted.

🚺 Warning

The data of the robot and the pulse encoder, including zero calibration data, are saved through their respective backup batteries. The battery depletion may cause data loss. The batteries in the controller and mechanism should be replaced regularly. When the battery voltage drops, the system may give an alarm to notify the user - please replace the battery timely.

Zero calibration method

- General calibration method
- > Direct writing method of zero encoding data

2.6.1 General calibration method

Select one or several axes and record their current readings as new zero data in the parameter file of the robot's Flash. The recording objects include main axis and additional axes of the robot (if any). It is possible to calibrate a single axis. (For example, if a user moves a robot to coincide the zero scale of a certain axis and then uses this function to achieve zero calibration of the robot.)

It is required to perform zero calibration when the loss of zero calibration data for a specific axis is caused by the voltage drop of the battery for the rear pulse counter or the replacement of the pulse encoder. Select the general calibration method and check multiple axes or a single axis for calibration. Check "complete" and click the "calibration" button to complete the calibration.

Fig. 2.41 Interface of General Calibration Method

The steps for general calibration method are as follows:

- 1. For a PUMA robot, align the zero-point reference marks of all axes. For a SCARA robot, align the zero-point reference marks of Axes 1, 2 and 4, but raise Axis 3 to the highest position.
- 2. Successively click "Menu Button" \rightarrow "System" \rightarrow "Basic Setting" \rightarrow "Zero-point Setting" to enter the screen as shown in Fig. 2.42.

Fig. 2.45 Status Changes to "Unsave"

6. Click "Save" to complete the calibration.

2.6.2 Direct input encoder calibration

As for the direct input encoder calibration, the zero calibration data can be directly entered into the system variables. This operation is used in the situations where zero calibration data is lost while pulse data is still maintained.

The steps for direct input encoder calibration are as follows:

- 1. Choose the "Direct Input Encoder Calibration" as the calibration method, click on the check box in front of the axis number, and select the axis to be calibrated.
- 2. Input zero-point data within the offset (note: the zero-point data corresponding to the offset is labeled on the base of the PUMA robot; not for the SCARA robot). Then click on "Calibrate" and finally click "Save".

Fig. 2.46 Window of Direct Writing Method

2.6.3 "Temporary Shield Error" function key

When a zero-point error is found on an axis, press the "Temporary Shield Error" button (but do not select a specific axis) to shield the axis reporting an error. So, the alarm axis of the robot can jump out of the alarm state and move on again (limited to joint teaching motion).

The "Temporary Shield Error" function key is only effective for axes with a "zero-point loss flag", while other axes continuously use the original "zero-point data".

After performing a new zero calibration on the problematic axis and saving the calibration data, the "zero calibration shield" flag on that axis disappeared. When the "zero calibration shield" flags on all axes disappear, the robot can resume its normal motion mode.

2.6.4 "Reset Encoder/Clear Encoder Battery Error" function key

It is necessary to clear the multi-circle of the encoder after the encoder is powered off or the robot body is reassembled. At this time, an "encoder battery error" alarm may appear generally. Note that the general calibration method or direct input method can be only used in the case of zero-point loss alarm.

Please note that the "Reset Encoder" function key (as shown in Fig. 2.47) can only be pressed when all axes of the robot are in mechanical zero position (as this function key is facing all axes of the robot). Otherwise, subsequent calibration may not achieve optimal accuracy.

Fig. 2.48 Reset Warning Window

After confirming the operation, clear the multi-circle data of all encoders and set the zero-point loss flag regardless of whether the previous zero-point was lost. The user is required to perform zero-point calibration.

Unreasonable clearing of multi-circle data may affect the accuracy of the robot and should be done carefully. If the user accidentally clear multi-circle values, it may lead to a decrease in the accuracy of the robot. Then, a dedicated calibrator should be used to recalibrate and restore the accuracy of the robot. If necessary, it is recommended to contact the robot manufacturer to perform the calibration.

2.6.5 Description of zero-point calibration scenarios

Scenarios where it is necessary to press the "ClearMmultiCircle" function key:

- Encoder battery is depleted (in general, a battery undervoltage alarm is shown on the alarm bar, similar to: "Servo-4108 Axis 1 Encoder Battery Error, etc."). At this point, after replacing the battery, the user should firstly clear the multi-circle information of the encoder and then perform a new zero calibration.
- When replacing the motor, it is necessary to unplug the battery cable, and the encoder may lose power as well. So, after motor replacement and before zero calibration, it is also necessary to clear the multi-circle of the encoder first.

Scenarios where it is unnecessary to press the "ClearMmultiCircle" function key:

A zero-point loss alarm or zero-point abnormality warning may appear. In this case, in case of a zero-point loss alarm, a zero-point calibration can be performed; in case of a zero-point abnormality warning, a pop-up of "Please manually confirm whether the zero point is normal" may appear when performing zero-point calibration. Click the Normal option, the warning will automatically disappear and the system will return to normal.

2.7 General setting

2.7.1 Time/Language setting

Successively click "Menu Button" \rightarrow "Administration" \rightarrow "Time/Language" to enter the screen as shown in Fig. 2.49.

The user can change current time and switch Chinese or English language.

2.7.3 Automatic screen-off

The screen is automatically off if the user does not operate for a certain period of time (default 10 min).

After screen off, the user can click the "Lock Screen" button to unlock the screen, which will light up again.

The user can also modify the automatic screen-off time in "Menu Button ->System ->Other Settings ->Preferences".

2.7.4 Modify IP

When being deployed independently and not connected to the subnet on the site, the robot can work directly by default IP.

When the robot is integrated into a certain subnet on the site, it may be necessary to modify IP of the controller and TP based on the subnet's IP range.

When a new TP is replaced, the self-test may fail during the first startup due to incorrect IP configuration of the controller paired with TP. At this moment, there is a button to select a controller on the interface. The user can click it to reconfigure IP of the controller to which TP is connected.

Please contact the manufacturer in case of any problems.

Steps to modify IP:

			Мо	dify TF	P IP			>	×
Modify TP IP to an idle IP in the subnet:	The following	ıg settings v	vill take	e effect al	fter the	e TP resta	rts		
Successively click "Menu	* IP Address :	192	•	168	•	110	•	102	
Button" → "Śystem" → "Other Settings" → "Modify	* Net Mask :	255	•	255	•	255	•	0	
TP IP" to enter the "Modify TP IP" screen.	* Gateway :	192	•	168	•	110	•	1	
	* DNS1:	114	•	114	•	114	•	114	
			Ø S	Shutdown	тр	Canc	H	Confirm	
Modify controller IP to an IP				v Contr					×
Modify controller IP to an IP in the subnet:	The followin						er rest	tarts	×
	The followint * New IP Address :						er rest	tarts	×
in the subnet: Successively click "Menu Button" → "System" → "Other Settings" → "Modify							er rest	tarts	×
in the subnet: Successively click "Menu Button" → "System" →	* New IP Address :	g settings v		e effect a		e controll	er rest		×
in the subnet: Successively click "Menu Button" → "System" → "Other Settings" → "Modify Controller IP" to enter the	* New IP Address : * Net Mask :	g settings v		e effect a		e controll			

\land Caution

If IP is modified to a different subnet, it is recommended to first modify the controller IP and then TP IP. Otherwise, they are on different subnets, possibly leading to the situation where the connection cannot be reached.

The robot controller and TP should be restarted after IP modification.

2.7.5 Find controller

This function is used to find which controller is in the same net as TP and to connect the controller (if found). This function is often available when a TP is compatible with multiple controllers.

Successively click "Menu Button" \rightarrow "System" \rightarrow "Other Settings" \rightarrow "Find Controller" to enter the "Find Controller" screen as shown in Fig. 2.51.

🚨 admin 🖂	calibration_four_point	UF:0 $ \sim$	Group:1	Base Coordinate 🖂	10%

2.8 System parameters

2.8.1 Type

- Model parameters: They are only related to the product model and derived from the design parameters generated by design and development. They may be mechanical parameters, controller parameters or verified performance parameters. The model parameters of the same model have the same format and numerical values, unless the design of the model has been changed.
- Robot parameters: They are physical parameters only related to a specific product or certain parameters not accurately calculated by the design theory. They are caused inevitably by inconsistencies in actual production and manufacturing and their values are different for each robot.
- User parameters: External interfaces are provided to allow the users to frequently change parameter values (the users are end users or function developers. Not all parameters are open to end users). These parameters are targeted towards application and based on application demands.
- Temporary parameters: They are parameter data temporarily recorded to meet certain mechanisms or software functions in the system. If being saved after power down, these parameters are generally recorded in NV-RAM. Otherwise, they are stored in the memory. They are only related to the state of the robot at a certain moment, but unrelated to physical properties, algorithm variables or user settings of the robot.

2.8.2 Configuration of user parameters - Setting of general system variables

Successively click "Menu Button" \rightarrow "System" \rightarrow "General System Variables" to enter the screen as shown in Fig. 2.53.

Description of general system variable parameters:

Contents of general system variables	Meaning
TP manual mode indication signal	Select the configured digital output signal. The signal status is ON when the TP mode selector is in the manual maximum speed mode or off otherwise.
TP manual speed limit mode indication signal	Select the configured digital output signal. The signal status is ON when the TP mode selector is in the manual limit speed mode or off otherwise.
Automatic mode indication signal	Select the configured digital output signal. The signal status is ON when the TP mode selector is in the auto mode or off otherwise.
TP offline mode indication signal	The controller is not equipped with a TP.
Check stability time once pose/angle Fine in place	Check stability time once pose/angle Fine in place, unit: s
Current pose register transfer has two types: joint transfer and Cartesian transfer.	When joint transfer is adopted, the data in the configured PR register is the current joint data of the robot. When Cartesian transfer is adopted, the data in the configured PR register is the current pose data of the robot. The PR register contains all PR parameters, including pose parameters, number of rotations, and joint configuration. The data in this PR register will be updated every 8ms.
Current TCP end speed	The configured register will represent current TCP speed, which is updated every 8ms.

2.9 User level

Some functions and settings can only be accessed by the users with appropriate levels. There are three user levels in the system:

- > Operator
- > Engineer
- Administrator (Admin)

Default password:

Except for the operator, every level needs a password to activate the system. Different users have different operation authorities. (The operation authorities of different users can be found in the section of system authorities for operators in the Safety Instructions)

The operator does not have a default password. The default passwords for other users are shown in the table below.

User type	Default password
Robot engineer	(This password can be modified under admin privilege.)
Admin	123

The steps to log in as a user are as follows:

1. Click "Login" in the status bar of TP to enter the login interface, as shown in the following figure:

	Login	×
* Name	Choose	\sim
* Password		
	Forget Password ?	
	× Cancel ✓ Cor	nfirm

Fig. 2.54 Login Interface

- 2. Click "Choose" to select the type of user to log in.
- 3. Enter the user password of corresponding type and click "Confirm" to complete the login.

Steps for robot engineer to modify the password

- 1. Log in as the admin.
- 2. Successively click "Menu Button" \rightarrow "User Management" to enter the user management interface, as shown in Fig. 2.55.

3 Composition of program

This chapter describes the composition and instructions of the program.

A robot application consists of instructions and other accompanying information required by the robot to perform tasks and recorded by the user.

In addition to program information describing how the robot performs tasks, the program also includes detailed information on defining properties.

Fig. 3.2 Program List Interface

The program is composed of the following information:

- > Line number assigned to each program instruction.
- > Action instruction instructing the robot to move in which direction and by which means.
- Program instruction containing the following contents.
 - Register instruction for storing numerical data.
 - Position register instruction for storing robot position data.
 - I/O (input/output) instructions for sending signals to and receiving signals from peripheral devices.
 - Transfer instructions (IF, WITCH, CALL) for changing the flow direction of the program when the defined conditions are met.
 - Wait instruction for postponing program execution.
 - Annotations added to the program.
 - Other instructions
- > The end marker indicates that no more instruction is left in the program.

3.1 Program property

The program properties are set on the program property screen. "Program property" is displayed when it is selected on the program list screen.

3.1.1 **Program name**

The program names are used to distinguish programs stored in the memory of the controller. It is not allowed to create more than 2 programs with the same name in the same controller.

Length

The length of the program name consists of 1 to 60 characters. The program name must be unique to the program.

Characters allowed

Letters: English letters.

Number: 0~9. The program name cannot start with a number.

Mark: Only _ (underline) allowed. @ and * cannot be used.

Contents

The program must be named in a way clarifying its purpose and function.

3.1.2 Comment

A comment can be added to the program name when a new program is created. The comment is used to describe additional information to display along with the program name on the program list interface.

Length

The length of the program comment consists of 1 to 1000 characters.

Characters allowed

Any character, number, symbol or Chinese character can be used.

Contents

The program comment must be described in a way clarifying the program purpose and function.

3.1.3 Program type

There are program types as follows:

- None The program called as a subprogram from the working program and used to execute specific tasks.
- > Main The program started as the main program from TP or an external device.
- > Macro The program used to execute macro instructions.

Main - Main program:

It can be called by Local Trigger, MPLCS and MPLCS Simple Trigger. When the program type is selected as Main or Macro, a list of program start points and program numbers is additionally shown on the program property interface. The programmer is allowed to choose whether to disable the "Program Start Point" function. As shown in Fig. 3.5, the program number should be set only when the program type is selected as Main. Please see Section 4.3 for details of the program starting points; additional descriptions of Section 4.2.2 for details of program numbers.

Fig. 3.4 Program Number Setting Fig. 3.5 Program Start Point Setting

Macro - Macro program:

During execution, a macro program can be called through macro start.

Introduction to macro program launch mode: The user can set it in the special program settings (macro settings) interface and each macro program corresponds to a DI one by one. A macro program can be started through pre-set I/O. When the program type is selected as Macro, a list of program start points and program numbers is additionally shown on the program property interface as well. The programmer is allowed to choose whether to disable the "Program Start Point" function.

None - General program:

There are no special restrictions or distinctions. In the auto mode, it cannot be started by any means other than Local Trigger mode (manually pressing the start button). However, it can be called by other programs.

3.1.4 **Program protection**

Write protection can be used to specify whether the program can be changed or deleted.

When program protection is enabled, it is not allowed to add data to the program or modify the program. After program commissioning, turn on program protection in the program list interface in order to prevent oneself or others from rewriting the program (Fig. 3.2 Program List Interface).

3.2 Line number, end marker, arrow and parameter

Line number

The line number is automatically inserted next to each instruction added to the program. When the instruction is deleted, the program automatically reassigns the number so that the initial line is always Line 1 and the second line is Line 2.

When the program is changed, the line number can be used to specify which line should be used as the object for moving, deleting or specifying the scope through the cursor.

In addition, the cursor can also be moved to the target line number by clicking "Jump To" in the program editing screen.

End marker

The end marker (END) is automatically displayed after the last instruction in the program. As new instructions are added, the end marker of the program can move towards the bottom of the screen while maintaining its position on the last line of the program.

When executing the last instruction to the end marker, the program ends and the arrow stops at the end marker.

Arrow

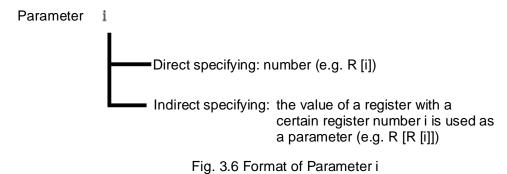

The line number pointed by the arrow indicates that the program has been executed to this line.

This chapter will explain program instructions required for program creation/modification in the following.

Programs are created/modified on the program editing screen (see Section 4.1 for program creation and modification).

Parameter i

The parameter i is the exponent used in the specification of control instructions (program instructions other than action ones). The parameter can be specified directly or indirectly. Direct specifying is usually to specify integers within the range of 1 to 32767. The range of values varies depending on the type of instruction used. Indirect specifying is to specify the register number.

3.3 Action instruction

The action instruction refers to the instruction causing a robot to move towards a designated position in the workspace at a specified velocity and method. The contents specified in the action instruction are as follows. The instruction format is shown in Fig. 3.3.

- > Action type Specify trajectory control towards the specified position.
- > Position data Teach the robot where it will move.
- > Movement speed Specify the movement speed of the robot.
- > Positioning type Specify whether to locate at the specified position.
- > Additional instruction Specify the execution of an additional instruction in an action.

It is required to teach action instructions (see Section 4.1.5 for creation of action instructions and Section 4.1.6 for modification of action instructions).

3.3.1 Action type

Action type specifies travel trajectory towards the specified position. Action types include: joint action without trajectory/pose control (MOVEJ), linear action with trajectory/pose control, and arm action.

- Joint action (MOVEJ)
- Linear action (MOVEL)
- Arc action (MOVEC)
- Jump action (only applicable to SCARA robots)

Joint action (MOVEJ)

MOVEJ is a basic method of moving a robot to a designated position. The robot accelerates and moves along all axes simultaneously, and then decelerates and stops simultaneously. The movement trajectory is usually non-linear. Record the type of action when teaching the end point. Joint movement velocity (%) is the percentage relative to maximum movement velocity. The pose of the moving tool is uncontrolled.

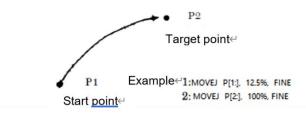

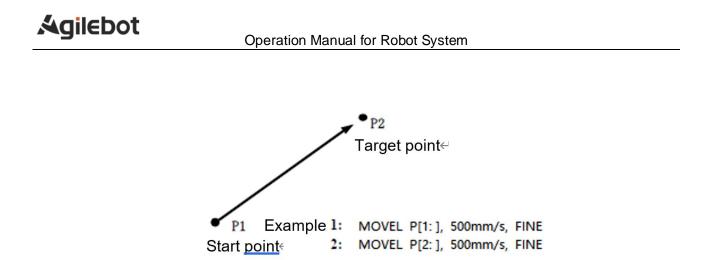

Fig. 3.7 Schematic Diagram of Joint Movement

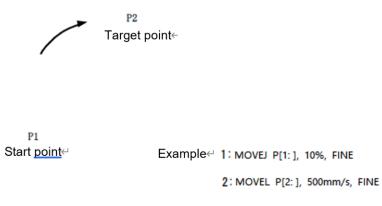

Linear action (MOVEL)

MOVEL is a movement method that the movement trajectory of the tool center point from the start point to the end point is controlled linearly. Record the type of action when teaching the end point. The unit of linear movement velocity is mm/s. The pose of the moving tool is controlled after the poses of start and target points are separated.

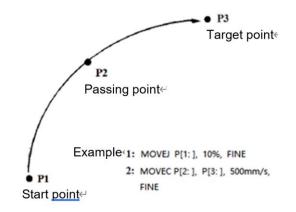

The rotation action is a movement method that the linear action is adopted to rotate the pose of a tool from the start point to the end point around the tool center point. The pose of the moving tool is controlled after the poses of start and target points are separated. The movement trajectory (when the tool center point is moving) is controlled linearly.

Arc action (MOVEC)

MOVEC is a movement method that the movement trajectory of the tool center point is controlled in an arc manner from the start point, via the passing point, to the end point. The passing point and target point are taught in an instruction. The unit of arc movement velocity is mm/s. The pose of the moving tool is controlled after the poses of start, passing and target points are separated.

Operation Manual for Robot System

Fig. 3.10 Schematic Diagram of Arc Movement

Jump

The main motion mode of Jump is to lift Axis Z to a specified height, keep the moving trajectory directly above the target point and then lower it to the target point for control.

JUMP

The JUMP instruction is to direct the robot to perform a Jump motion (first vertically ascending, then horizontally moving and finally vertically descending). This instruction takes the current point of the robot (referring to the endpoint of the previous instruction during continuous automatic operation) as the starting point of JUMP and the point specified in the statement as the endpoint of JUMP. MOVEJ is adopted in the whole process.

Instruction format:

JUMP P [i], speed1, speed2, positioning type, LimZ, additional conditional instruction 1, additional conditional instruction 2

- > Description of statement parameters:
 - P[i]: It represents the target position and can be specified directly by P[i] or indirectly by PR[i].
 - Speed1: The speed unit is mm/s. It can be directly specified by a constant or indirectly specified by MR[i]. It refers to the speed of rise or fall.
 - Speed2: With the speed multiplier from 1 to 100%, it refers to the speed of horizontal movement.
 - Positioning type: There are two types: SD and FINE, as detailed in Section 3.3.4.
 - LimZ: It represents the upper limit of Coordinate Z of the robot in Jump motion and can be directly specified by a constant or indirectly specified by MR[i].
 - Additional conditional instruction 1: optional (omitted). The instruction "Approach" has the general form of ARCH (Arch1, Arch2). Arch1: It can be an R register or a number. It can be used to specify the transfer distance (vertical distance from the starting point) before a horizontal action through the Jump instruction. (Unit: mm) Arch2: It can be an R register or a number. It can be used to specify the approach distance (vertical distance from the target point) for completely ending the horizontal movement through the Jump instruction. (Unit: mm)
 - Additional conditional instruction 2: optional (omitted). The instruction has Offset, Tool Offset, TB, TA and DB for choosing (see Section 3.3.5 for details).
- > Example of instruction programming:

JUMP P[1:], 500mm/s, 12.5%, SD20, LimZ 130, ARCH (30 50), Offset

JUMP3

JUMP3 is an instruction requiring the robot to perform a jump motion (used to combine 2 linear actions and 1 joint action). It is applicable to SCARA robots. It contains a starting point and three designated points, of which adjacent two points form 3 line segments in sequence. The points specified in the linear motion statement of the first and last segments and in the PTP motion statement of the middle segment are used as the endpoints of the JUMP3 instruction.

Instruction format:

JUMP3 P[i], P[j], P[k], speed1, speed2, positioning type, additional conditional instruction

- > Description of statement parameters:
 - P[i]: It is a transfer point higher than current position and can be specified directly by P[i] or indirectly by PR[i].
 - P[i]: It is an approach point above the target coordinate point and can be specified directly by P[i] or indirectly by PR[i].
 - P[k]: It is a target coordinate point and can be specified directly by P[i] or indirectly by PR[i].
 - Speed1: The speed unit is mm/s. It can be directly specified by a constant or indirectly specified by MR[i]. It refers to the speed of Axis-Z rise or fall.
 - Speed2: With the speed multiplier from 1 to 100%, it refers to the speed from P[i] to P[j].
 - Positioning type: There are two types: SD and FINE, as detailed in Section 3.3.4.
 - Additional conditional instruction: optional (omitted). The instruction has Offset, Tool Offset, TB, TA and DB for choosing (see Section 3.3.5 for details).
- > Example of instruction programming:

JUMP3 P[1:], P[2:], P[3:], 500mm/s, 12.5%, SD20, Offset

JUMP3CP

JUMP3CP is an instruction requiring the robot to perform a jump motion (used to combine 3 linear actions). It is applicable to SCARA robots. It contains a starting point and three designated points, of which adjacent two points form 3 linear segments in sequence.

Instruction format:

JUMP3CP3 P[i], P[j], P[k], speed, positioning type, additional conditional instruction

- Description of statement parameters:
 - P[i]: It is a transfer point higher than current position and can be specified directly by P[i] or indirectly by PR[i].
 - P[i]: It is an approach point above the target coordinate point and can be specified directly by P[i] or indirectly by PR[i].
 - P[k]: It is a target coordinate point and can be specified directly by P[i] or indirectly by PR[i].
 - Speed: The speed unit is mm/s. It can be directly specified by a constant or indirectly specified by MR[i]. It refers to the speed of Axis-Z rise or fall.
 - Positioning type: There are two types: SD and FINE, as detailed in Section 3.3.4.
 - Additional conditional instruction: optional (omitted). The instruction has Offset, Tool Offset, TB, TA and DB for choosing (see Section 3.3.5 for details).
- > Example of instruction programming:

JUMP3CP P[1:], P[2:], P[3:], 500mm/s, SD20, Offset

3.3.2 Position data

Position data stores the position and pose of the robot. When action instructions are taught, position data is also written into the program.

Position data includes: joint coordinates based on joint coordinate system and Cartesian coordinates represented by tool positions and poses in the workspace.

Cartesian coordinate

The position data based on Cartesian coordinates is defined through four elements: TCP position (origin of tool coordinate system) in the Cartesian coordinate system, tool pose, form, and Cartesian coordinate system used.

The world or user coordinate system is used in the Cartesian coordinate system. The selection of these Cartesian coordinate systems will be discussed later in this section.

Position and pose

- Position (x, y, z): The TCP position (origin of tool coordinate system) in a Cartesian coordinate system is represented by 3D coordinates.
- Pose (A, B, C) It is represented by the rotation angle around Axes X, Y and Z in the Cartesian coordinate system.

Form

Form refers to the pose of the main body of the robot. There are multiple forms meeting the conditions of Cartesian coordinates (X, Y, Z, A, B, C). To determine the form, it is necessary to specify the joint configuration and rotation number for each axis.

Joint configuration

The joint configuration represents the configuration of wrist and arm. It is to specify which side the control points of wrist and arm are located relative to the control surface. The robot is located at a singular point (special pose) when the control points are overlapping with each other on the control surface. The robot cannot operate for there are infinite forms based on specified Cartesian coordinates on the singular point.

- The robot cannot work at positions located at singular points. (In some cases, the most obtainable form can be selected for operation.) In this case, teaching can be performed through joint coordinates.
- In straight lines/arcs, the robot cannot pass through singular points on the path (joint configuration cannot be changed). In this case, joint movement is adopted.

Rotation number

The number of rotation represents the rotation number of the axis (J4) for a SCARA robot and of the axes (J3, J4, J6) for a PUMA robot. These axes return to the same positions after a rotation. So, it is required to specify the number of rotations. The rotation number of each axis is 0 at a position of 0°.

In the case of programmed linear and arc actions, the robot moves towards the target point in the closest pose leaving from the starting point. At this moment, the rotation number at the target point is automatically selected. So, the actual rotation number of the robot at the target point may differ from that shown in the position data in some cases.

Verify Cartesian coordinate system

The verification of the Cartesian coordinate system is to detect which coordinate system number is used when the positional data based on Cartesian coordinates are reproduced.

Operation Manual for Robot System

If 0-10 is specified in the number of tool coordinate system and in the number of user coordinate system, the coordinate system number during teaching should be the same as that during reproduction. Otherwise, the robot collision may occur. The coordinate system number is written into the position data during position teaching. To change the written coordinate system number, it is required to change (activate) the coordinate function by the tool/user and then teach the point again.

Number of tool coordinate system (UT)

The number of tool coordinate system is specified by the number of the end flange or tool coordinate system. The coordinate system on the tool side is determined accordingly.

- > 0: The default tool coordinate system (end flange coordinate system) is used.
- > 1-10: The tool coordinate system with the specified number is used.

Number of user coordinate system (UF)

The number of user coordinate system is specified by the number of the world or user coordinate system. The coordinate system of the workspace is determined accordingly.

- > 0: The base coordinate system is used.
- > 1-10: The user coordinate system with the specified number is used.

Position variable - P[i]

The position variable is a standard variable for position data storage. The position data is automatically recorded when the action instruction is taught.

The following Cartesian coordinate system and number are used when Cartesian coordinates are taught.

- Coordinate system with currently selected tool coordinate system number (UT=0-10).
- Coordinate system with currently selected user coordinate system number (UF=0-10).

The following Cartesian coordinate system and number are used during reproduction.

- Coordinate system with taught tool coordinate system number (UT=0-10).
- > Coordinate system with taught user coordinate system number (UF=0-10).

Position register - PR[i]

The position register is a universal variable used to store position data. (For position teaching of position register, see Section 5.1.3)

The following Cartesian coordinate system and number are used when Cartesian coordinates are taught.

- > Coordinate system with currently selected tool coordinate system number (UT=0-10).
- > Coordinate system with currently selected user coordinate system number (UF=0-10).

The following Cartesian coordinate system and number are used during reproduction.

- Coordinate system with taught tool coordinate system number (UT=0-10).
- Coordinate system with taught user coordinate system number (UF=0-10).

🔼 Caution

Due to no UF/TF in the PR register, it represents the pose of the specified TF under the currently

activated UF during program execution. So, switching between different UF/TF may result in different positions of the actual robot in space.

P represents local pose data, including UF/TF. If P is used in the motion instruction but inconsistent with UF_No and TF_No, the program cannot continuously execute downwards and it is required to modify UF_No and TF_No to make them consistent with P record.

Position number - P[i]

Names (containing 31 characters at most) can be added to the position number and the position register number.

Example: MOVEJ P[1:point1], 10%, FINE

MOVEJ PR[1:point2], 10%, FINE

3.3.3 Movement speed

The robot's movement speed can be specified in the motion instruction. The movement speed is limited by the speed multiplier during program execution. The speed multiplier ranges from 1 to 100%. The unit specified in the movement speed varies according to the type of action taught by the action instruction.

MOVEJ P[1:], 10%, FINE

When the action type is MOVEJ, the ratio of relative maximum movement speed can be specified in the range of 1-100%.

MOVEL P[2:], 500mm/s, FINE

When the action type is MOVEL or an arc action, the unit is mm/s and the ratio is specified between 1 and 4000 mm/s.

Specify the speed through the motion register (MR).

It is allowed to specify the speed through the motion register. Thus, the movement speed of the action instruction can be specified after it is calculated in the motion register.

Caution

This function can be used to freely change the robot's movement speed through the motion register. Therefore, sometimes it may cause the robot to act at unexpected speeds according to the specified motion register value. When this function is adopted, it should be noted to fully confirm the specified motion register value during teaching/operation.

Display of action instruction for the movement speed specified through the motion register

- > MOVEJ P[1:], MR[i:]%, FINE
- MOVEL P[2:], MR[i:]mm/s, FINE
- MOVEC P[3:], P[4:], MR[i:]mm/s, FINE

3.3.4 **Positioning type**

The end-of-action method can be defined for the robot in the action instruction based on the positioning type. There are two positioning types under standard circumstances.

Operation Manual for Robot System

- FINE positioning type
- SD positioning type

FINE positioning type

MOVEJ P[1:], 10%, FINE

According to the FINE positioning type, the robot stops at the target position (positioning) and then moves towards the next target position.

SD positioning type

MOVEJ P[1:], 10%, SD 50

According to the SD positioning type, the robot approaches the target position and proceeds to the next position with no complete stop at that position.

The extent that a robot approaches the target position is defined by a value between 0 and 1000.

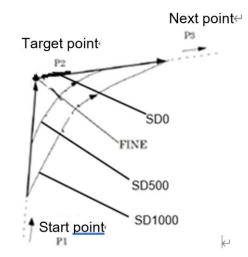

When 0 is defined, the robot moves at the closest position to the target and proceeds to the next position with no complete stop at that position.

The greater the SD value, the lower the deceleration of the robot near the target position and the farther away the robot from the target position.

Caution

In the case of programmed wait and other instructions after the action instruction of SD is specified, the robot may stop on the trajectory of the corner and execute this instruction under standard settings.

When multiple actions are continuously performed with short distance and fast speed in the SD mode, even the SD value of 1000 may cause the robot to slow down.

3.3.5 Additional instructions for actions

Additional instructions cause a robot to perform specific tasks during its actions. There are additional instructions as follows.

- Tool offset instruction Tool_Offset
- Position offset instruction
 Operation Manual for Robot System

9 "`	Operation Manual f	or Robot System
\blacktriangleright	Trigger before instruction	ТВ
\triangleright	Trigger after instruction	ТА
\triangleright	Distance-based trigger instruction	DB
\triangleright	Motion parameter switch instruction	Swift
\triangleright	Remote tool center point instruction	RTCP
\triangleright	Skip instruction	SKIP

Tool offset instruction (tool center point)

MOVEL P	[1:]], :	500mm/s,	FINE,	TOOL_OFFSET	PR[2:] [[1]
						1	1
						Required arameter	Optional parameter

Required parameter: It represents offset with the type of PR register.

Optional parameter: Tool coordinate system as offset reference

Tool offset instruction - The target position recorded in the position data causes the robot to move to a position only offsetting the offset amount specified in the tool offset condition. The offset condition is specified by the tool offset condition instruction.

The tool offset conditions specify the following elements:

- > The position register specifies the direction and amount of offset.
- > The tool coordinate system is used when offsetting.
- The current tool coordinate system is used if a tool coordinate system is not specified as the offset reference. If a tool coordinate system is specified as the offset reference, the offset is based on the specified coordinate system.

If the basic motion instruction is MoveJ (the offset object point, i.e. target P[n] in the Move instruction, is executed in joint form), it will be transformed into joint coordinates to execute the offset on the joint even if the expression specifying the offset PR[x] is in a Cartesian coordinate system. However, the transformation process is executed based on the offset reference specified by the TF[i] parameter.

Position offset instruction (Offset)

MOVEL P[1:],	500mm/s,	FINE,	OFFSET	PR[2:	UF[2]
				1	1
				Required parameter	Optional parameter

Required parameter: It represents offset with the type of PR register.

Optional parameter: User coordinate system as offset reference

Position offset instruction - The target position recorded in the position data causes the robot to move to a position only offsetting the offset amount specified in the position offset condition. The offset condition is specified by the position offset condition instruction.

The position offset conditions specify the following elements:

- > The position register specifies the direction and amount of offset.
- > The offset of the joint is used when the position data is the joint coordinate.
- When the position data is a Cartesian coordinate, the user coordinate system specified by the optional parameter is used as the offset reference. If not specified, the current user coordinate system (UF) is used.

In addition to PR, a specific point information can also be used as a required parameter in the position offset instruction. C_VEC (X, Y, Z, A, B, C) or J_VEC (J1, J2, J3, J4, J5, J6) directly specifies the offset. Among them, the data is of Cartesian type in C_VEC and joint type in J_VEC.

If the basic motion instruction is MoveJ (the offset object point, i.e. target P[n] in the Move instruction, is executed in joint form), it will be transformed into joint coordinates to execute the offset on the joint even if the expression specifying the offset PR[x] is in a Cartesian coordinate system. However, the transformation process is executed based on the offset reference specified by the UF[] parameter.

Trigger before instruction (TB)

Perform signal output and call the subprogram before the specified time when the robot action ends (excluding motion instructions. If the subprogram contains motion instructions, an error will be reported with the error code "Program-2328"). The specified time range is 0.01-30s. The input smaller than 0.01 will not be saved successfully (except for 0).

Format:

- > Action statement + TB + specified time + CALL program name
- > Action statement + TB + specified time + output signal

DO[i] can be selected as the output signal.

Example:

MoveJ P[1] 100% FINE TB 1.00S CALL PROGRAM

The robot moves to P1 through joint motion, and calls the program in the first 1s before reaching P1.

MoveJ P[1] 100% FINE TB 1.00S DO[1]=ON

The robot moves to P1 through joint motion, and sets DO[1] to ON in the first 1s before reaching P1.

Trigger after instruction (TA)

Perform signal output and call the subprogram after the specified time when the robot action ends (excluding motion instructions. If the subprogram contains motion instructions, an error will be reported with the error code "Program-2328"). The specified time range is 0.01-30s. The input smaller than 0.01 will not be saved successfully (except for 0).

Format:

- Action statement + TA + specified time + CALL program name
- > Action statement + TA + specified time + output signal

DO[i] can be selected as the output signal.

Example:

MoveJ P[1] 100% FINE TA 1.00S CALL PROGRAM

The robot moves to P1 through joint motion, and calls the program in the first 1s after reaching P1.

> MoveJ P[1] 100% FINE TA 1.00S DO[1]=ON

The robot moves to P1 through joint motion, and sets DO[1] to ON in the first 1s after reaching P1.

Distance-based trigger instruction (DB)

When the robot TCP moves to a distance within a specified range from the target position of the motion instruction, this instruction allows the moving robot to execute signal output or call subprogram (excluding motion instructions).

Format:

- > Action instruction + DB specified distance + CALL program name
- > Action instruction + DB specified distance + Signal output

DO[i] can be selected as the output signal.

Parameter:

Specified distance: When entering a spherical range centered around the target point of the motion instruction, TCP executes the trigger instruction. The radius of this spherical range is determined by the specified distance.

Example:

MOVEL P[1] 100% FINE DB 100.00mm, DO[3]=ON

The robot moves towards P1 in a linear motion. Set DO[3] to ON when the robot's TCP enters a space with P1 as the spherical center and a radius of 100mm.

> MOVEL P[2] 100% FINE DB 50.00mm, CALL A

The robot moves towards P1 in a linear motion. Call subprogram when the robot's TCP enters a space with P1 as the spherical center and a radius of 100mm.

Motion parameter switch instruction (Swift)

SWIFT instruction: It is used to switch motion parameters (acceleration, acceleration, etc.) to meet faster beat requirements.

Example:

> MOVEJ P[1] 50% FINE, SWIFT

Remote tool center point coordinate system instruction (RTCP)

When executing remote TCP actions, it is necessary to add an additional instruction RTCP of remote tool action in the instructions. The RTCP coordinate system is essentially the same as the user coordinate system and the data is also the same. Only when the RTCP additional instruction is added into the motion instruction, the user coordinate system adopted for pose recording may become the RTCP coordinate system. In case of no RTCP additional instruction, it still maintains the user coordinate system. This

change is reflected in the algorithm processing in the control system. No clear distinction is made between the RTCP coordinate system and the user coordinate system on the configuration page.

L Caution

RTCP cannot be used during joint movement.

Example:

Relative to remote TCP, move the workpiece to P[1] at a relative velocity of 2000mm/s:

MoveL P[1] 2000mm/s Fine RTCP

Relative to remote TCP, move the workpiece from P[1] to P[2] at a relative velocity of 2000mm/s:

MoveC P[1] P[2] 2000mm/s Fine RTCP

Skip instruction (SKIP)

The SKIP instruction is used to directly jump from the current line containing the SKIP instruction to the target instruction line or program when the jump condition set by the SKIP CONDITION instruction (see Section 3.6.5) is met. It is often used in conjunction with the motion instruction SKIP CONDITION.

Instruction format: action instruction + SKIP GOTO LABEL [i]/CALL + program name

Example:

- 1 SKIP CONDITION DO[2]=ON
- 2 MOVEL P[1], 200 mm/s, FINE, SKIP GOTO LABEL[1]
- 3 MOVEJ P[2], 12.5%, FINE
- 4 LABEL[1]
- 5 MOVEJ P[3], 12.5%, FINE

The program starts executing from the first line. When DO[2]=ON, the program jumps to the fourth line after the second line ends and continuously executes downwards from the fourth line. When DO[2]=OFF, the program continuously executes downwards from the current line after the second line ends.

3.4 Register instruction

The register instructions perform arithmetic operations on registers. There are several types of registers.

- > Number register instruction
- Position register instruction
- > Position register element instruction
- String register and string instruction
- Motion register instruction
- Modbus special register instruction

<u> </u>Caution

All registers can be called directly through numerical values, or indirectly through combinatorial operation of number registers. They are called direct specifying method and indirect specifying method.

The expression examples are as follows: PR[R[20]], SR[20+R[2]], R[R[1]+R[2]]

As for the register operations, the following polynomial operations can be performed.

Example

R[2]=R[3]-R[4]+R[5]-R[6]

R[10]=R[2]*100/R[6]

3.4.1 Number register instruction

A number register is a variable used to store an integer or decimal value. 1500 number registers are available under standard circumstances.

R [i]=(value), where i is the number of the number register (1-1500)

The value can be:

- Constant
- R[i]: Value of register R[i]
- PR[i, j]: Value of position PR element [i, j]
- DI[i]: Digital input signal
- > DO[i]: Digital output signal
- UI[i]: System input signal
- UO[i]: System output signal
- String
- Method: SIN, COS, etc. (see Section 3.10 for specific methods)

The arithmetic symbols of a number register include addition (+), subtraction (-), multiplication (*), division (/), remainder (MOD), and integer part of the quotient (DIV).

Example:

R[i] = (value) + (value)

R[i] = (value) + (value) instruction is to substitute the sum of two values into a number register.

R[i] = (value) - (value)

R[i] = (value) - (value) instruction is to substitute the difference between 2 values into a number register.

R[i] = (value) * (value)

R[i] = (value) * (value) instruction is to substitute the product of two values into a number register.

R[i] = (value) / (value)

R[i] = (value)/ (value) instruction is to substitute the quotient of 2 values into a number register.

R[i] = (value) MOD (value)

R[i] = (value) MOD (value) instruction is to substitute the remainder of 2 values into a number register.

R[i] = (value) DIV (value)

R[i] = (value) DIV (value) instruction is to substitute the integer part of the quotient of 2 values into a number register.

R[i] = (x-(x MOD y))/y

3.4.2 Position register instruction

The position register instructions perform arithmetic operations on position registers. The position register instruction can perform substitution, addition and subtraction processing.

A position register is a variable used to store position data (X, Y, Z, A, B, C). 200 position registers are available under standard circumstances.

PR[i] = (value)

PR[i] = (value) instruction is to substitute the position data into the position register. Where, i is the number of the position register (1-200).

The value can be:

- > PR[i]: Value of position register [i]
- > P[i]: Value of teaching position [i] in the program
- L_POS: Cartesian coordinate of current position (see Section 3.8.4)
- > J_POS: Joint coordinate of current position (see Section 3.8.3)

Example:

PR [1] = L_POS PR [2] = PR [3]

PR [3] = P[1:]

PR[i] = (value) + (value).

PR[i] = (value) + (value) instruction is to substitute the sum of two values.

PR[i] = (value) - (value) instruction is to substitute the difference between 2 values.

 $PR[3] = PR[3] + L_POS$

PR[4] = PR[R[1]]

3.4.3 **Position register element instruction**

The position register element instruction performs arithmetic operations on position registers.

In PR[i, j], i represents the number of the position register and j represents the number of the position register element. The position register element instruction can perform substitution, addition and subtraction processing, and is described in the same way as the number register instruction.

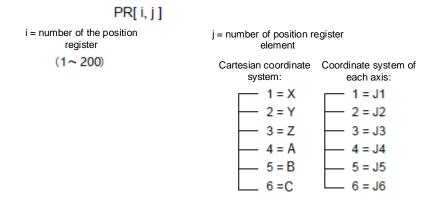

Fig. 3.11 Diagram for Position Register Element

PR[i, j] = (value)

PR[i, j] = (value) instruction is to substitute the element value of the position data into the position register element.

Where, i is the number of the position register (1-200).

The value can be:

- Constant
- R[i]: Value of register [i]
- PR[i, j]: Value of position PR element [i, j]
- MI[i]: Modbus register (hold type)
- MH[i]: Modbus register (input type)

Refer to Section 3.4.6 for Modbus registers.

Example:

PR [1, 1] = R [3]

PR [4, 3] = 324.5

PR[i, j] = (value) + (value)

PR[i, j] = (value) + (value) instruction is to substitute the sum of two values into a position register element.

PR[i, j] = (value) - (value)

PR[i] = (value) - (value) instruction is to substitute the difference between 2 values into a position register element.

PR[i, j] = (value) * (value)

PR[i, j] = (value) * (value) instruction is to substitute the product of two values into a position register element.

PR[i, j] = (value) / (value)

PR[i, j] = (value) / (value) instruction is/ substitute the quotient of two values into a position register element.

PR[i, j] = (value) MOD (value)

PR[i, j] = (value) MOD (value) instruction is to substitute the remainder of two values into a position register element.

PR[i, j] = (value) DIV (value)

PR[i, j] = (value) DIV (value) instruction is to substitute the integer part of the quotient of 2 values into a position register element.

PR [4, 3] = PR [1, 3] - 3.528

3.4.4 String register and string instruction

For string registers, a maximum of 255 characters can be stored in each register. Maximum number of string registers is 300.

SR[i] = (value)

SR[i] = (value) instruction is to substitute string data into the string register.

The value can be: Constant, (number register R[i], string register SR[i]), String, Method

It can be transformed from numerical data to string data. Retain 6 decimal places and round off excess parts.

It can be transformed from string data to numerical data. The transformation value is the numerical value before the first character in the string.

Example SR[i]=R[j]

Value of R[j]	Result of SR[j]
R[j]=1234	SR[j]=1234
R[j]=12.34	SR[j]=12.34
R[j]=5.123456789	SR[j]=5.123457

Example R[i]=R[j]

Operation Manual for Robot System

Value of SR[j]	Result of R[i]
SR[j]=1234	R[i]=1234
SR[j]=12.34	R[i]=12.34

SR[i]=(value) (operator) (value)

SR[i]=(value) (operator) (value) instruction is to combine two values and substitute the result of the operation into a string register.

In each operation, the data type depends on the (value) to the left of the (operator).

If the value on the left is string data, the strings are combined with each other.

If the value on the left is numerical data, arithmetic operations are performed. At this point, if the (value) on the right is a string, the numerical value before the first character is used for the operation.

The operator is: + (combine)

Example SR[i]=R[j]+SR[k]

Values of R[j] and R[k]	Result of SR[j]
R[j]=123.456+SR[k]=345.678	SR[j]=456.134
R[j]=456+SR[k]=1abc2	SR[j]=457

Example SR[i]=SR[j]+R[k]

Values of SR[j] and R[k]	Result of SR[j]
SR[j]=123.+R[k]=456	SR[j]=123.456
SR[j]=def+R[k]=81573	SR[i]=def81573

3.4.5 Motion register instruction

A motion register can be understood as a motion variable specific to the motion instruction. It is convenient for debugging the speed of many identical motion instructions. The calculation operation of the MR register is the same as the number register R. The MR register can only be used and appears in motion instructions. The MR register only supports integer type and a decimal (if any) in the calculation assignment is rounded off.

MR[i] = value

There are two data types for values: constant and register (R/PR[i,j]/MI[i]/MH[i]).

Example:

MR[1:]=500

MOVEL P[1:], MR[1:]mm/s, FINE

The robot moves towards P1 in a linear motion at a speed of 500mm/s.

3.4.6 Modbus special register instruction

The Modbus special register is used in Modbus communication to communicate with the Modbus master station. 120 holding registers and 120 input registers are available under standard circumstances.

MH/I[i] =(value), where i is the number of the Modbus special register (1-120).

The value can be:

- > Constant
- R[i]: Value of register R[i]
- > PR[i, j]: Value of position PR element [i, j]
- > MI[i]: Value of input register
- > MH[i]: Value of holding register

3.5 I/O instruction

The I/O instruction can achieve signal interaction with peripheral devices (e.g. PLCs) and control application processes by reading the input signal (DI/UI/RI) status and changing the output signal (DO/RO) status.

L Caution

Before use of I/O signals, it is required to map logical numbers to physical numbers. (For mapping of I/O, see Section 2.1.1)

3.5.1 Digital I/O instruction

Digital input (DI) and digital output (DO) are input/output signals that the user can control.

R[i] = DI[i]

The R[i] = DI[i] instruction is to store the state of the digital input (ON=1, OFF=0) in a register.

Example:

R[1]= DI[1]

R[R[3]]= DI[R[4]]

DO[i] = ON/OFF

The DO[i] = ON/OFF instruction is to turn on or off the specified digital output signal.

Example:

DO[1] = ON

DO[R[3]] = OFF

DO[i] = PULSE, [time]

The DO[i] = PULSE, [time] instruction is to switch on within the specified time and output the specified digital output; the unit of time is hour and second. What is the range of pulse output time?

Example:

DO[2] = PULSE, 0.2 s

DO[R[3]] = PULSE, 1.2 s

DO [i]=R[i]

The DO [i]=R[i] instruction is to turn on or off the specified digital output signal according to the value of the specified register. It is turned off if the value of the register is smaller than or equal to 0 and turned on if it is greater than 0.

Example:

DO [1] = R [2] DO [R [5]] = R [R [1]]

Operation Manual for Robot System

3.5.2 Robot I/O instruction

The usage of robot (RO/RI) I/O instruction is the same as that of digital (DO/DI) I/O instruction. Sp, please refer to the usage of digital (DO/DI) I/O instruction.

3.6 Logical instruction

Logical instructions of Agilebot robots include IF, SWITCH and WHILE instructions. The logical instructions can also be understood as conditional control instructions, of which the code block to be executed is determined based on the execution result (True or False) of one or more statements. The execution process of conditional statements can be easily understood through the following figure:

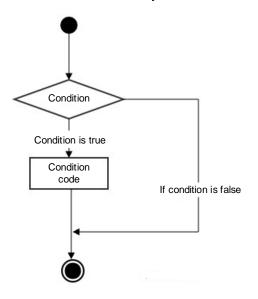

Fig. 3.12 Schematic Diagram of Conditional Statement Execution Process

3.6.1 IF instruction

Instruction format:

IF Condition 1 Statement block 1 ELSE IF Condition 2 Statement block 2

ELSE

Statement block 3

END IF

- > Execute the statement block 1 if Condition 1 is true.
- > Judge Condition 2 if Condition 1 is false.
- > Execute the statement block 2 if Condition 2 is true.
- > Execute the statement block 3 if Condition 2 is false.

Condition types judged by IF

- Register type (number register R[i], string register SR[i])
- I/O type (DO/UO/DI/UI)

3.6.2 SWITCH instruction

The SWITCH instruction is usually used to handle the situation where a judgment variable has multiple different values, in order to simplify the program and improve its readability.

Instruction format:

SWITCH subject

CASE pattern_1

Action_1

BREAK

CASE pattern_2

Action_2

BREAK

DEFAULT

Action_3

BREAK

BREAKEND SWITCH

Execute the statement after DEFAULT when all CASEs cannot be matched.

Execute the corresponding Action_x when the values of subject and pattern_x are the same.

Subject can be register (R[*], SR[*]), I/O type, constant or method.

Pattern can be register (R[*], SR[*]), I/O type, constant, method or string.

The BREAK statement is a jump action.

Caution

CASE must be used in conjunction with BREAK.

The example of the Switch logical instruction programming is shown in the following figure:

```
SWITCH R[10: default]
2
3
  CASE 1
    R[11: default] = R[10: default] +
4
                                        1
5
    BREAK
6
 CASE 2
    R[11: default] = R[10: default] + 2
7
8
    BREAK
9
  END SWITCH
```

Fig. 3.13 Switch Programming Example

3.6.3 WHILE instruction

The WHILE instruction, also known as loop instruction, is generally used to control programs or actions to be executed repeatedly.

Instruction format

WHILE judgment conditions

Execute Statement 1

CONTINUE

Execute Statement 2

BREAK

Execute Statement 3

END WHILE

When the loop instruction WHILE is executing, the robot runs until the judgment condition is not met. Otherwise, after the BREAK statement, it jumps out of the loop instruction and executes the instruction after END WHILE. The difference between Continue statement and Break statement is that the Continue statement only ends the current loop rather than the whole loop; the Break statement ends the whole loop process and does not judge whether the loop conditions are met.

The execution flowchart of WHILE is as follows:

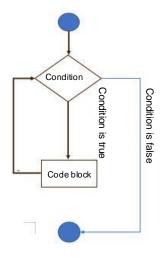

Fig. 3.14 Execution Process of WHILE Statement

Type of judgement condition

- Register type (number register R[i], string register SR[i])
- I/O type (DO/UO/DI/UI)

The example of WHILE instruction programming is shown in the following figure:

Operation Manual for Robot System

Operation Manual for Robot System

```
Program Name: K_Main @_Modified

1

2 WHILE DI[2] = DI[2]

3 MOVEJ P[1: ], 90%, FINE

4 WHILE DI[1] \diamond ON

5 MOVEL P[2: ], 500mm/s, FINE

6 END WHILE

7 END WHILE

8 END
```

Fig. 3.15 Example of WHILE Instruction Programming

3.6.4 GOTO instruction

The GOTO instruction is used to jump to the specified label position in the same program and continuously execute the program downwards from the specified label position. The GOTO instruction can only be used after a label instruction LABEL has been inserted (see Section 3.8.11).

Instruction format:

GOTO LABEL[i]

Example:

- 1 MOVEL P[1], 200 mm/s, FINE
- 2 LABEL[1]
- 3 MOVEL P[1], 200 mm/s, FINE
- 4 MOVEJ P[2], 12.5%, FINE
- 5 GOTO LABEL[1]
- 6 MOVEJ P[3], 12.5%, FINE

When the program is executed from Line 1 to Line 5 (GOTO LABEL [1]), it may jump to Line 2 (LABEL [1]) and continue executing from Line 2.

3.6.5 SKIP CONDITION instruction

The SKIP CONDITION instruction is to set jump conditions and is often used in conjunction with the additional action instruction SKIP (see Section 3.3.5). It directly jumps from current line containing the SKIP instruction to the target instruction line or program when the jump condition is met.

Instruction format: SKIP CONDITION (I/O type/register type)

Example:

- 1 SKIP CONDITION DO[2]=ON
- 2 MOVEL P[1], 200 mm/s, FINE, SKIP GOTO LABEL[1]
- 3 MOVEJ P[2], 12.5%, FINE
- 4 LABEL[1]
- 5 MOVEJ P[3], 12.5%, FINE

The program starts executing from the first line. When DO[2]=ON, the program jumps to the fourth line after the second line ends and continuously executes downwards from the fourth line. When DO[2]=OFF, the program continuously executes downwards from the current line after the second line ends.

3.7 Structure instructions

The structure instructions are used to control the program execution process, including CALL, WAIT, WAIT TIME, PAUSE, ABORT, RUN, LOAD, UNLOAD and EXEC instructions.

3.7.1 CALL - Call program instruction

Instruction format: Call + program name. It is used to call a subprogram, form nesting, improve program reusability and readability and reduce programming workload. For example, in the process of robot application, it is required to control the movement of the end fixture at different positions.

Operation Manual for Robot System

As shown in the following figure, the program initialization calls the subprogram calibration_fou_point.

```
Program Name: K_Main@_Modified

      1

      2
      CALL calibration_four_point

      3
      WHILE DI[2] = DI[2]

      4
      MOVEJ P[1: ], 90%, FINE

      5
      WHILE DI[1] <> ON

      6
      MOVEL P[2: ], 500mm/s, FINE

      7
      END WHILE

      8
      END WHILE

      9
      END
```

Fig. 3.16 Example of Call Instruction Programming

3.7.2 WAIT - Waiting for conditions to meet

Instruction format: WAIT + Condition + TIMEOUT + SKIP/Waring/Called Program

Description of parameters:

The available data types for conditions include I/O type (DI/DO/UI/UO) and register type (R[i]/MI[i]/MH[i]).

TIMEOUT:

Optional parameters (not-required parameters). Its meaning is the waiting time (s). It can be specified by a constant or number register.

When the WAIT instruction does not use the additional condition TIMEOUT: Execute the WAIT instruction. Only when the conditions are met can the program continue to execute downwards. Otherwise, it will wait until the conditions are met.

When the WAIT instruction uses the additional condition TIMROUT: Execute the WAIT instruction. The program continues to execute downwards if the condition is met within the specified waiting time or pauses at the WAIT instruction if the condition is not met within the specified waiting time.

SKIP/Waring/Called Program:

Optional parameters (not-required parameters). In case the optional parameter TIMEOUT is used, one of the optional parameters can be selected from three parameters SKIP/Waring/Called Program.

If the SKIP parameter is used:

The program continues to execute downwards if the condition is met within the specified waiting time or skips the current line (WAIT instruction line) and continues to execute downwards if the condition is not met within the specified waiting time.

If Waring is used:

Execute the WAIT instruction. The program continues to execute downwards if the condition is met within the specified waiting time or pauses at the WAIT instruction if the condition is not met within the specified waiting time.

Execute the WAIT instruction if the called program is used. The program continues to execute downwards if the condition is met within the specified waiting time or executes the called program and then continues to execute downwards if the condition is not met within the specified waiting time.

The following figure is an example of the wait instruction programming.

```
9 WAIT R[5:] = 1
10 WAIT DI[*] = ON
11 WAIT R[5:] = 1 TIMEOUT=2sec
12 END
```

Fig. 3.17 Example of WAIT Instruction Programming

3.7.3 WAIT TIME - waiting time instruction

Instruction format:

WAIT TIME + waiting time (s).

WAIT TIME can be specified by a constant or number register.

Before the waiting time ends, the robot stops executing instructions until the waiting time ends. The waiting time can be a numerical value or a register.

The programming example is shown in the following figure.

```
Program Name : K Main & Modified
      CALL calibration_four_point
    1
    2
      WHILE DI[2] = DI[2]
    3
         WAIT 0.5 sec
        MOVEJ P[1: ], 90%, FINE
    4
    5
         WHILE DI[1] \diamondsuit ON
    6
            WAIT 1 sec
            MOVEL P[2: ], 500mm/s, FINE
    7
    8
        END WHILE
    9 END WHILE
   10 END
```

3.7.4 PAUSE - Pause instruction

Instruction format: Pause

When the Pause instruction is encountered, the program is paused and the robot immediately plans a deceleration trajectory and stops its motion. The program state enters a paused state. Press the Start button again to continue execution.

The following figure is an example of the PAUSE instruction programming.

```
Program Name : K Main
      CALL calibration_four_point
    1
    2
      WHILE DI[2] = DI[2]
         IF DI[3] = ON
    3
    4
            PAUSE
    5
         END IF
    6
         MOVEJ P[1: ], 90%, FINE
         WHILE DI[1] \diamondsuit ON
    7
            MOVEL P[2: ], 500mm/s, FINE
    8
    9
         END WHILE
   10 END WHILE
   11
      END
```

```
Fig. 3.19 Example of PAUSE Instruction Programming
```

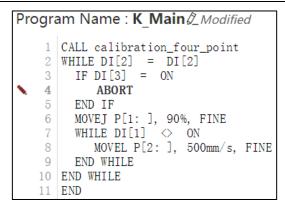

3.7.5 ABORT - Abort instruction

Format: ABORT

Mandatory end instruction: End program execution, immediately brake the servo motor of the robot and apply the holding brake, and power off the servo bus. After the mandatory end instruction, the program enters a termination state and the cursor stops at the current line.

The following figure is an example of the ABORT instruction programming.

Operation Manual for Robot System

3.7.6 **RUN - Multithread instruction**

RUN instruction can be used to run multiple programs simultaneously.

Format: RUN + program name

Program type: User program (XML and JSON), Script program (PYTHON)

Insert Instruction Quick Operation		~	Back Close
RUN	*		
User Program List	a	a1	A111
User Program List	a55	A_LX	A_RMC
Script List Internal Program List	a_test	a_track	aa
	aaa	ASAS	asd
	atest	axis1_test	axis2_test
	axis3_test	axis4_test	axis5_test
Confirm	axis6_test	Basic_Test_IF	Basic_Test
Cancel	Racic Tost	Racic Test	Racic Tost

Fig. 3.20 Example of RUN Instruction Insertion

Caution

Notes:

- If the RUN instruction is used in the Main program to call the Pick program, Main is called the "caller", Pick is called the "callee", and the one called by the "callee" is also called the "callee" (the same below).
- The CALL instruction only executes a program at a time. However, the RUN instruction allows multiple programs to be executed simultaneously. It does not wait for the completion of the "callee" before executing the "caller".
- When the same program is called by RUN for multiple times, subsequent runs may not be responded to and there is an INFO event if the first execution is not completed.
- Only the caller can write motion instructions. If the callee has motion instructions, an alarm

may be sent out with the alarm code "program-2328".

Reset button:

• For the caller program, the callee program will also be reset.

Pause/abort:

• If the caller is paused/aborted, all callees may be paused/aborted as well.

Single step & positive sequence:

- Single step is only available when all programs are paused or aborted.
- When the caller is executing in single step & positive sequence, the callee, after being executed, may follow the caller to perform in single step & positive sequence line by line.
- If single step & positive sequence is adopted in the callee, only the callee is executing in single step & positive sequence line by line, but the caller will not follow it.

Single step & reverse sequence:

• Ignore the RUN instruction and do not execute it.

Status bar:

- Program name and line number: The running program (if any) is displayed; otherwise, the last program run or opened is displayed.
- Robot's operation status:

If the caller is still present, the status depends on the caller. If not, the status is WORKING if one of the callees is running or ON-STANDBY otherwise.

UI:

- Start/Restore: Control all programs.
- Stop: Control all programs.
- Abort: Control all programs.

UO:

- Pause status: similar to the description of robot's operation status.
- Program Running: similar to the description of robot's operation status.

3.7.7 Load - Dynamic program loading

Definition: Dynamically loading programs

Format: Load + program (e.g. "pick")

In this instruction, the program may specify register types (R [i]/SR [i]), strings and constants.

3.8 Other instructions

3.8.1 **TF_NO - Tool coordinate system instruction**

It is to switch tool coordinate systems in programs and is generally used in conjunction with UF_NO.

Instruction format: TF_No = tool coordinate system number; the data type of the "Tool Coordinate System Number" can be selected from two types: register type (R) and constant.

\land Caution

Due to no UF/TF in the PR register, it represents the pose of the specified TF under the currently activated UF during program execution. So, switching between different UF/TF may result in different positions of the actual robot in space.

P represents local pose data, including UF/TF. If P is used in the motion instruction but inconsistent with UF_No and TF_No, the program cannot continuously execute downwards and it is required to modify UF_No and TF_No to make them consistent with P record.

3.8.2 UF_NO user coordinate system instruction

It is to switch user coordinate systems in programs and is generally used in conjunction with TF_NO.

Instruction format: TF_No = user coordinate system number; the data type of the "User Coordinate System Number" can be selected from two types: register type (R) and constant.

Caution

Due to no UF/TF in the PR register, it represents the pose of the specified TF under the currently activated UF during program execution. So, switching between different UF/TF may result in different positions of the actual robot in space.

P represents local pose data, including UF/TF. If P is used in the motion instruction but inconsistent with UF_No and TF_No, the program cannot continuously execute downwards and it is required to modify UF_No and TF_No to make them consistent with P record.

3.8.3 J_POS current joint coordinate instruction

It indicates the current position in the joint coordinate system and is often used in conjunction with the pose register PR.

Example

PR[i] = J_POS Assign current position in the robot's joint coordinate system to the position register PR [i].

3.8.4 L_POS current Cartesian coordinate instruction

It indicates the current position in the Cartesian coordinate system and is often used in conjunction with the pose register PR.

Example

PR[i] = J_POS Assign current position in the robot's joint coordinate system to the position register PR [i].

3.8.5 Payload_NO - payload setting instruction

It is used to switch the payload number in the program. For example, during the application, only the payload of the fixture is left at the end of the robot arm before the workpiece is grasped, but a combined payload of the fixture and the workpiece is on the end of the robot arm after the workpiece is grasped. Then, the payload data before and after grasping are recorded with different payload numbers.

Instruction format: PAYLOAD_NO = load record number; the data type of "Payload Record Number" can be selected from two types: register type (R) and constant.

3.8.6 Timer - timer instruction

Program Timer instruction: it is used to start or stop a program timer. The start or stop of the timer can be controlled by its status. The global timer supports multi-program (task) sharing.

Instruction format

1. Timer[i] = value There are four data types of values, namely status (Start/Stop/Reset), register (R), constant and method (please refer to Section 3.10).

When the value is the status

Timer[i]=Start; the time starts.

Timer[i]=Stop; the time stops.

Timer[i]=Reset; the timer resets (value resetting)

In [i],i represents the timer number, which can be specified directly by a constant or indirectly by the number register R.

2. Assignment: R[i]=Timer [i] (provided that Timer must have a defined state; if not, Timer is null and cannot be assigned).

3.8.7 Comment - Commend instruction

The comment instruction is used to add comments to a program to improve its readability, and this comment has no impact on program operation.

Format: #(Comment text)

The comment text supports all data types.

3.8.9 OVC - Overall velocity instruction

It is used to modify the overall velocity.

Instruction format: Overall_Velocity_Coefficient = velocity percentage. There are two data types for "velocity percentage": number register type (R) and constant.

3.8.10 OVC - Overall acceleration instruction

It is used to modify the overall acceleration.

Instruction format: Overall_Acceleration_Coefficient = acceleration percentage. There are two data types for "acceleration percentage": number register type (R) and constant.

3.8.11 LABEL - Label instruction

It defines program labels and is often used in conjunction with the GOTO instruction (see Section 3.6.4) and SKIP CONDITION instruction (see Section 3.6.5).

Format: LABEL [i: Comment]; where, i is the tag number and Comment is the tag comment information.

3.8.12 Socket - Socket instruction

Overview:

SocketOpen: Use SocketOpen instruction to create a Server and wait for the Client to connect.

SOCKET OPEN SK[*], parameter

The parameter SK [*] represents the current socket device used, and the optional parameter represents the statement execution result (see Chapter 10 Socket Error Code List) and is represented by a number register (R [*]).

SocketConnect: Use SocketConnect to create a Client and connect a Server.

SOCKET CONNECT SK[*], parameter

The parameter SK [*] represents the current socket device used, and the optional parameter represents the statement execution result (see the Socket Error Code List) and is represented by a number register (R [*]).

SocketRecv: The SocketRecv instruction is used to read characters from a Socket and can specify a maximum length

SOCKET RECV SK[*], R[*], SR[*], parameter2

The parameter SK [*] represents the current socket device used, the parameter R [*] represents the acceptance length; SR [*] indicates that the received data exists in the string register (SR [*]), and the optional parameter 2 represents the statement execution result (see the Socket Error Code List) and is represented by a number register (R [*]).

Additional descriptions:

- Both Server and Client can call this instruction.
- Length of received string: maximum value is 254.
- The parameter "Accept default timeout" configured in the SK register of the instruction is valid for this instruction.

SocketSend: The SocketSend instruction is used to write a string to a Socket and send it to the opposite end.

SOCKET SEND SK[*], "", parameter2

The parameter SK [*] represents the current socket device used, the parameter "" represents the content (string) to be sent, which can be a constant or a string register (SR [*]), and the optional parameter 2 represents the statement execution result (see the Socket Error Code List) and represented by a number register (R [*]).

Additional descriptions:

- > Both Server and Client can call this instruction.
- Maximum length is 254 if the string to be sent is represented by SR.

It is allowed to directly send a constant string or store the string in a string register and send the content by selecting that register.

SocketClose: The SocketClose instruction is used to close the connection;

SOCKET CLOSE SK[*], parameter

The parameter SK [*] represents the current socket device used, and the optional parameter represents the statement execution result (see the Socket Error Code List) and is represented by a number register (R [*]).

Caution

Optional parameters may or may not be used. Choose whether to use them according to actual needs. Except for optional parameters, other parameters are necessary.

3.8.13 Compound operation instruction

Compound operation instruction can combine various operators and data in assignment, conditional comparison and wait statements of TP program. The compound operation instruction supports the parenthesis "()".

The compound operation instruction can be used in register, IF, WAIT and WHILE instructions.

The compound operation instruction is specified in parentheses as shown below.

IF DI[1] = (DO[2] AND DO[3])

Execute statement

END IF

In case of no parentheses in a sentence, it becomes a common operation instruction.

Data type

The following data types can be used in the compound operation instruction.

Туре	Value	Data
Numerical value	Numerical values can be processed as data. Both integers and real numbers can be used.	Elements of registers, constants and position registers
Bool	The data can be set to any value of ON or OFF.	DI/O, UI/O, ON, OFF

Operator

The following operators can be used in the compound operation instruction.

Operator	Operation			
+	Addition operation of left and right sides			

Operation Manual for Robot System

-	Subtraction operation of left and right sides
*	Multiplication operation of left and right sides
1	Division operation of left and right sides
MOD	Division remainder of left and right sides
DIV	Integer part of division quotient of left and right sides

> The data of numerical type can only be used for arithmetic operators.

> The output data of arithmetic operators is always numerical.

Operator	Operation			
AND	Logical product of left and right sides			
OR	Logical sum of left and right sides			

Logical operators are only applicable for Boolean data.

Operator	Operation
=	Return ON when left and right sides are equal. Return OFF when left and right sides are unequal.
<>	Return ON when left and right sides are unequal. Return OFF when left and right sides are equal.
<	Return ON when left side is smaller than right side. Return OFF when left side is greater than right side.
>	Return ON when left side is greater than right side. Return OFF when left side is smaller than right side.
<=	Return ON when left side is smaller than or equal to right side. Return OFF when left side is greater than right side.
>=	Return ON when left side is greater than or equal to right side. Return OFF when left side is smaller than right side.

> "=" and "<>" can be used in both numerical and Boolean data.

> "<", ">", "<=" and ">=" can only be used in numerical data.

The following shows the priority order of operators.

Priority	Operator
High	*, /, DIV, MOD
	+, -
Medium	<, >, <=, >=
	=, <>
	AND
Low	OR

Conditional statement

The following are examples of compound operation instructions used in conditional instructions. Operation Manual for Robot System $\mathsf{IF} (\mathsf{R}[1] = (\mathsf{PR}[1, 6] + \mathsf{R}[1]) * \mathsf{R}[2])$

IF (DI[1] AND (DI[2] OR DI[3]))

- > Compound expressions can be used in conditional statements.
- > The result of a conditional statement must be Boolean.

Wait instruction

The following is an example of compound operation instructions used in wait instruction.

WAIT (DI[1] = ON AND (DI[2] = ON OR DI[3] = ON))

- > Compound expressions can be specified in conditional statements of wait instruction.
- > The result of a conditional statement must be Boolean.
- > The wait instruction is waiting before the expression result becomes ON.

Addition and modification of compound operation instructions

For the instructions with compound operation function, the instruction editing interface provides symbol descriptions and the symbols in the following table are adopted to add and modify compound operation instructions.

List of Symbols Used for Addition and Modification of Compound Operation Instructions

+	Add an expression.
	Remove an expression (i.e. at least one expression, namely, at least a term to the right of the equation)
()	Add parentheses.
	Remove parentheses.

3.9 String instructions

3.9.1 StrLen - String length instruction

It is used to obtain the length of a string and bring the result into a register. It is commonly used as R[i]=StrLen (value).

The data type of the value is usually a constant string or a string register (SR).

Example:

If R[i] = StrLen ("666"), the value of R[i] is 3.

If R[i] = StrLen (SR[i]), where SR[i]=111111, the value of R[i] is 6.

3.9.2 FindStr - String search instruction

R [i]=FindStr (Value 1, Value 2); the data type of Value 1 and Value 2 is usually a constant string or a string register (SR).

Value 1 represents the "object string", Value 2 represents the "string to search for", and R[i] represents the position of the string to search for in the object string. From left to right, the position of the first character is 0 in the object string, and so on. When the searched string is not found, the value of R[i] is - 1.

Example:

R[i] = FindStr ("123456", "1") The value of R[i] is 0.

R[i] = FindStr ("123456", "0") The value of R[i] is -1.

3.9.3 SubStr - String subtraction instruction

SR[i]=SubStr (Value 1, Value 2, Value 3).

Value 1 represents the "object string", Value 2 represents the "start point position", and Value 3 represents the "string length to be subtracted". Among them, the data type of Value 1 is usually a constant string or a string register (SR), and the data types for Values 2 and 3 are usually constants or number registers (R). SR [i] represents the subtracted string.

SR[i]=SubStr (Value 1, Value 2, Value 3) instruction is to subtract a partial string from an object string and substitute its result into a string register. The subtracted string is determined according to the start point position of the first character of the object value and the string length to be subtracted.

Example:

SR[i]=SubStr ("P123456", 0, 1) The value of SR[i] is "P".

3.10 Methods (functions)

3.10.1 SIN - Sine function

Sin (Sine) is used to calculate the sine value of an angle.

Basic example

The following example describes the function Sin.

```
R[1:]=Sin(*)
```

R [1:] is to obtain the sine value of *. Range of sine values = (-1, 1).

3.10.2 COS - Cosine function

Cos (Cosine) is to calculate the cosine value based on the angle of relevant data type "num".

Basic example

The following example describes the function Cos.

```
R[1:]=Cos(*)
```

R[1:] is to obtain the cosine value of *. Range of cosine values = (-1, 1).

3.10.3 TAN - Tangent function

Tan (Tangent) is used to calculate the tangent value of an angle.

Basic example

The following example describes the function Tan.

R[1:]=Tan (*)

R [1:] is to obtain the tangent value of *.

3.10.4 ARCSIN - Anti-sine function

ArcSin is used to calculate the anti-sine value of an angle.

Basic example

The following example describes the function ArcSin.

R[1:]= ArcSin(0.5)

R [1:] is to obtain the ArcSin value (30) of 0.5.

3.10.5 ARCCOS - Arccosine function

ArcCos is used to calculate the arccosine value of an angle.

Basic example

The following example describes the function ArcCos.

```
R[1:] = ArcCos(-0.5)
```

R [1:] is to obtain the ArcCos value (120) of -0.5.

3.10.6 ARCTAN - Arctangent function

ArcTan is used to calculate the arctangent value of an angle.

Basic example

The following example describes the function ArcTan.

```
R[1:]= ArcTan(1)
```

R [1:] is to obtain the ArcTan value (45) of 1.

3.10.7 ABS - Absolute value function

Abs is to obtain absolute values, namely positive values of digital data.

Basic example

The following example describes the function Abs.

```
R[1:]=Abs(R[2:])
```

Specify R[1:] as the absolute value of R[2:].

3.11 CollisionDetect Command

3.11.1 CollisionDetect

It is used to set the collision detection ON/OFF.

Instruction format: CollisionDetect ON/OFF, GROUP *, AXIS *; where, GROUP and AXIS parameters are optional.

Optional parameter GROUP *: Motion group; the parameter of the robot motion group is 1 (currently, it does not support external axis configuration).

Optional parameter AXIS *: Axis, which represents one of Axes 1-6 of the robot when the motion group is 1 (select the axis according to the actual situation).

When the optional parameter is not used, it indicates that collision detection is turned on/off for all motion groups.

Basic example

The following example describes the CollisionDetect instruction.

CollisionDetect ON, GROUP 1, AXIS 1; It indicates the collision detection of Axis 1 of the robot.

CollisionDetect ON; It indicates the collision detection of all axes of the robot.

3.11.2 CollisionRange

It is used to set the collision detection deviation. The greater the deviation value of collision detection, the more sensitive the robot's collision detection; vice versa.

Instruction format: CollisionRange * %, GROUP *, AXIS*; where, GROUP and AXIS parameters are optional.

Optional parameter GROUP *: Motion group; the parameter of the robot motion group is 1 (currently, it does not support external axis configuration).

Optional parameter AXIS *: Axis, which represents one of Axes 1-6 of the robot when the motion group is 1 (select the axis according to the actual situation).

When the optional parameter is not used, it indicates that the collision detection sensitivity of all motion groups is *%.

Basic example

The following example describes the CollisionRange instruction.

CollisionRange 30%, GROUP 1, AXIS 1; It indicates that the collision detection sensitivity of the robot's Axis 1 is 30% of maximum sensitivity.

CollisionRanget 30%; It indicates that the collision detection sensitivity of all robot axes is 30% of maximum sensitivity.

4 **Program creation and execution**

The creation, modification, deletion and other operations of the programs must be carried out in the manual mode but not in the auto mode.

4.1 Create Program

There are two ways to create a program:

 Click "Menu Button" → "Program" to enter the interface as shown in Fig. 4.1. Click "Create Program", and a new program interface will pop up as shown in Fig. 4.2. After filling in program name and comments and selecting the program type on this interface, click "Confirm" to complete the program creation.

Fig. 4.4 Program Editing Interface

Description of buttons:

"Back"	Return to the program list interface.
	Edit existing program instructions:
"Modify instruction"	Move up/down: Move the current program line instruction before or after the previous line;
	Copy/Cut: Copy or cut current program line instruction to the clipboard;
	Paste: Paste the content on the clipboard to the next line of the current program line;
	Undo/Redo: Cancel or redo the previous operation;

	Disable/Enable: Disable or enable the current program line instruction. It may							
	also be conveniently used for debugging. Add a blank line: Add a new blank line on the next line of the current program line.							
"Insert Instruction"	nsert a new instruction, such as "common instructions, motion instruction, ogical instruction, assignment instruction, I/O instruction, structure instruction and other instructions".							
	Move the line number of initial running program to the line number pointed by the cursor,							
"Arrow to	for example, the initial program line number is no longer the first line, but the fifth line in the following figure. The execution cursor is an arrow. It is located at the far left of the program line number, indicating the program line number. This operation can only be performed in the manual mode.							
Cursor"	Program Name : a1 1 2 WAIT 1 sec 3 D0[1] = 0N 4 WAIT 2 sec 5 D0[1] = 0FF 6 END							
"Jump To"	Indicate the corresponding program line number in the input program. Click "go" to move the cursor to the program line number.							
"Continuous"	It is selected at default, indicating that the program is executed continuously in a positive order until the selected program is completed or paused/aborted.							
"Single step & Execute the programs one by one with a single step and in a positive positive execution status remains "paused".								
sequence"	This operation can only be performed in the manual mode.							
"Single step &	Execute the programs one by one in a reverse sequence. Press it once to run an instruction at a time. After execution, the program execution status remains "paused".							
reverse sequence"	Only motion instructions rather than control instructions can be executed in the reverse sequence.							
	This operation can only be performed in the manual mode.							
"Pose"	Usually, the pose list is hidden on the right side of the program editing interface, as shown in Fig. 4.5; it only appears when the user clicks on it. The pose list contains private P and global PR of the program. After these points are changed during programming or modified on the PR register interface, the pose list interface should also be changed accordingly; vice versa. In addition, when the servo is powered on, press and hold the "Move" button in the bottom left corner to slowly move the robot to the pose after it is selected in the pose list interface.							
"I/O Status"	Usually, this interface is hidden on the right side of the programming interface, as shown in Fig. 4.5; it only pops out when the user clicks on it. This interface has the same contents as and share data with the "Communication $\rightarrow I/O$							

	Status" interface. It is to facilitate the user to monitor I/O status during programming and debugging.
"Register"	Usually, this interface is hidden on the right side of the programming interface, as shown in Fig. 4.5; it only pops out when the user clicks on it. This interface has the same contents as and share data with relevant register interface. It is to facilitate the user to monitor the register status during programming and debugging.

Description of function keys on pose, I/O status and register interfaces:

Function key	Specific function
X	Click here to lock the "Pose", "I/O Status", and "Register" interfaces in the program editing screen. Click again to unlock them. It facilitates monitoring of relevant data status during debugging.
P	Click here in the upper left corner of the pose screen to only display P variable poses.
PR PR	Click here directly above the pose screen to only display PR variable poses.
Clear Unused P	Click here in the upper right corner of the pose screen to delete P and PR poses you want to delete, or to clear all poses with one click.
TF: 0: 🔽	Click here on the pose screen to select which tool coordinate system is used as the reference for the established poses.
UF: ALL 🔽	Click here on the pose screen to select which user coordinate system is used as the reference for the established poses.
P[1:] Teach Record Edit	Choose the desired pose in the pose screen, where you can re-teach pose data and manually edit pose data.
"Move to point"	After the servo is powered on in the robot's manual mode, choose the pose to be moved in the pose screen and click here to move the robot to the target pose.

"Create"	Click here in the pose screen to create new pose data for the robot.
"Delete"	Click here on the pose screen to delete the pose data you want.
do 🖂	Click here on the I/O status screen to switch between the I/O types to be monitored.
Only Mark	Click here on the I/O status screen to mask the monitored I/O status information.
Only Active	Click here on the I/O status screen to mask unconfigured I/O states and only display I/O states successfully configured.
R	Click here on the register screen to switch to MR and SR register monitoring screens.
Mark Only	Click here on the I/O status screen to mask the monitored register status.

4.1.2 Copy program

Select the desired program in the program list interface and click "Copy Program" as shown in Fig. 4.6. The user can copy the currently selected program and redefine the name, comments and type of the copied program. (Note: The program name cannot be the same as the name in the current program list) Copy Program is only open at or above the programmer level.

Operation Manual for Robot System

Fig. 4.16 Point or Position Register Creation Window

There are two "P[*]" position types: P [i] and PR [i]. P [i] can be understood as a local variable, namely, P [i] in each program can exclusively be used in that program. PR [i] can be understood as an overall variable and shared for all programs. They should be selected according to actual needs.

Parameter i can be specified only directly when P [i] is used or indirectly when PR [i] is used. When Parameter i can be indirectly specified, i in PR [i] can be an MR register, for example, **MOVEL PR[MR[1:]], 500mm/s, FINE** shows the indirect method. The speed parameter can also be specified by the MR register. Click the speed parameter in the motion instruction editing interface to modify it. Click the positioning type parameter "FINE" to modify the positioning type.

New Pose

Click <u>New Pose</u> to create P or PR.

Record Pose

It is in light color "Record Pose" if the pose to be taught or modified again is not selected and in deep color

"Record Pose" after the pose has been selected for teaching. Then, click "Record Pose" to update pose data.

Save as Template

After clicking on "Save as Template", the following screen will appear on the "Common Instructions" and "Motion Instructions" interfaces.

Fig. 4.17 Motion Instruction Template Window

Click the motion instruction statement in Quick Edit to quickly insert motion instructions into the program.

4.1.6 Modify motion instruction

Select the motion instruction to be modified in the program editing interface, and a cursor will appear in front of the selected statement line, as shown in Fig. 4.12.

After clicking "Edit Instruction", the following screen will appear.

Modify	Instruction	Edit Tool	Quick operation	Close
MOVE	LINE~ P[10]	1600mm/s	FINE +	
		Record F	ose	
(Save as te	Confin	m Cancel	

Fig. 4.17 Motion Instruction Editing Window

Refer to the "create instruction" steps in Section 4.1.5 to modify it.

4.1.7 Create additional instruction

Based on the previous section, click "+" after the motion instruction in the editing interface, and the following screen will appear.

Modify Instruction	on Edit	Tool C	uick operation	Close
MOVE LINE~	P[10] 1600	mm/s FI	NE +	
	A	ttribute		
Sw	ift		Acceleration	
RTG	CP		Offset

VOFF	FSET		SKIP	
Save as	to 📕	Confirm	Cancel	
Save as		confirm	Cancel	

Fig. 4.18 Additional Instruction Editing Window

Select the required additional parameters. Refer to Section 3.3.5 for instructions on additional parameters.

4.1.8 Insert control instruction

Control instructions are a general term for program instructions (other than action instructions) used on the robots.

Insert If instruction

After clicking "Insert Instruction" in the program editing interface, enter the instruction selection interface. Then, click "Common Instruction" or "Logical Instruction" as shown in the following figure.

Insert Instruct	ion Quick operation	Close	Insert Instruct	tion Quick operation	Close
	Move Line	Move Joint		IF	SWITCH

Fig. 4.19 Insert Instruction Window

An example of IF statement programming is shown in Fig. 4.20:

IF R[1:] 2 = R[3:] 3 R[11:] = 1ELIF R[3:] = R[4:]4 5 R[11:] = 26 ELSE 7 R[11:] = 38 END IF 9 END

Fig. 4.20 Example of IF Instruction Program	Fig. 4.20	Example	of IF	Instruction	Program
---	-----------	---------	-------	-------------	---------

Additional descriptions of IF statement

In the IF statement editing interface, click IF to switch among IF, ELSE IF and ELSE, as shown in the following figure.

Fig. 4.21 IF Instruction Switching Interface

Before inserting ELSE IF or ELSE, it is necessary to insert IF. Otherwise, ELSE IF or ELSE cannot be inserted successfully and error prompts will appear as well.

Click "*" in the IF statement interface in Fig. 4.22 to display the IF statement parameter editing interface for adding judgment conditions.

Fig. 4.22 IF Statement Parameter Editing Interface

Parameter 1 include registers and I/O, of which the register type includes number register R [i] and the I/O types include special I/O and digital I/O.

Parameter 2 includes register, I/O and I/O status, of which the register type includes number register R [i], the I/O type includes special I/O and digital I/O, and the I/O status includes ON and OFF.

Element type

It refers to optional register and I/O type for Parameter 1 or Parameter 2.

Element list

It refers to specific elements for register and I/O type of Parameter 1 or Parameter 2. Only elements created or configured are displayed in this list.

Explanation of symbols in the detailed interface of IF statement

+	Add an expression.
	Remove an expression (i.e. at least one expression, namely, at least a term to the right of the equation)
()	Add parentheses.
	Remove parentheses.

Click "=" to switch operators in the IF statement editing interface. For the types of replaceable operators and their usage methods, please refer to 3.8.11 Compound Operation Instructions.

Insert SWITCH instruction

Please refer to the insertion method of IF instruction.

Insert WHILE instruction

Please refer to the insertion method of IF instruction.

Insert register and I/O instructions

See Section 3.4 for description of register instructions.

Insert number register - R[i]

Click "Insert Instruction" on the program operation interface to enter the instruction selection interface \rightarrow Click "Assign and I/O" to switch to the "Assign and I/O" instruction interface, as shown in Fig. 4.23.

Fig. 4.45 Program Menu Window

4.2.1 Special program setting

Special program setting is macro program setting.

A macro program is a program with program property set to Macro.

Besides the general program calling method, macro programs can also be started by pre-configuring and defining I/O.

Path to setting interface of macro program: Menu button \rightarrow Program \rightarrow Special program setting, as shown in Fig. 4.46.

Multiple macro configurations can be set in the macro program setting interface to determine which input signal can be used to call which macro program.

The start signal for each set of macro configurations is unique and cannot be reused with other macro configurations. However, macro programs can be used in various macro configurations. So, the same macro program can be called by different launch signals. However, the same signal can only call a macro program (it is impossible to send a signal to simultaneously call two macro programs).

The following describes setting elements on the interface:

Macro CMD: It gives a special name for the macro configuration or provides simple explanation of the macro's purpose. The user can define it independently (supporting up to 32 characters). It is allowed to leave it blank.

- Macro program: It is a program with program property selected as Macro. The macro program drop-down menu in this interface shows current macro programs in the system.
- > I/O: The I/O type, which can be configured for macro launch, is DI.
- > Valid or invalid: Determine whether the macro program settings are valid.

Fig. 4.46 Special Program Setting Interface

4.2.2 Setting of program launch mode

When the operation mode is the auto mode, the program has four launch modes: Local Trigger, MPLCS, Macro Trigger and MPLCS Simple Trigger.

The user can click "Menu Button" - "Program" - "Program Launch Mode Setting" in sequence to enter the program trigger mode setting interface as shown in Fig. 4.47. Specify one of these four trigger modes to launch the robot program. The default mode of the system is "Local Trigger".

Launch Mode	Local Trigger	^
	Local Trigger	
	MPLCS	
	Macro Trigger	
	MPLCS Simple Trigger	

Fig. 4.47 Program Launch Mode Setting Interface

Local Trigger

Local Trigger is that the user selects and opens the desired program (i.e. enter the program editing interface), and clicks the Start button on the TP, and the program runs continuously from the first line.

"Local Trigger" is applicable to all types of programs.

Preconditions for "Local Trigger"

- > The operation mode of the robot is the "auto mode".
- > The running status of the robot is "On-Standby".
- > The program execution status is "Finished".
- > The "program launch mode" is set as Local Trigger.
- > An executable program has been loaded (open it to enter the program editing interface).

MPLCS

MPLCS is to trigger the main program by its trigger number.

The trigger number of the main program is in decimal.

The process of MPLCS is as follows:

- 1. When "MPLCS" is enabled, the system receives the Selection Strobe signal (UI[6]) from the upper computer to maintain a high level.
- 2. As long as the UI[6] signal remains at a high level, the system may read the level states (0/1) of six UI signals from UI[8] to UI[13] to form a 6-bit binary number.
- 3. The system may also provide feedback on the 6-bit binary number read by itself through 6 UOs (Selection Confirm) and maintain a high-level signal of Selection Check Request (UO[6]) to the upper computer for checking the request.
- 4. After receiving UOs [6], the upper computer checks if the outputs of six UOs are consistent with the given values. If consistent, it sends an MPLCS Start to the robot system (UI[7]) and disconnects it after a certain time (this time must be longer than 100 ms).
- 5. After obtaining UI[7], the robot system converts the 6-bit binary number into a decimal number and follows this number to find main programs with the same main program number. (If not found, it reports an alarm event).
- 6. It triggers the main program if found. Meanwhile, it sends the UO[7] (MPLCS Start Done) to the upper computer.
- 7. Then, the upper computer turns off UI[6] and UI[8]-UI[13] signals.
- 8. Once detecting that the UI[6] signal disappears, the robot system resets UO [6], UO [8] UO [13] and UO [6] signals.

Caution

At present, considering the I/O limit of the standard I/O board, the UI Program Selection and UO Selection Confirm used for MPLCS start only need 6 bits to form a 6-bit trigger code.

The specific time sequence can be referred to Fig. 4.48:

Operation Manual for Robot System

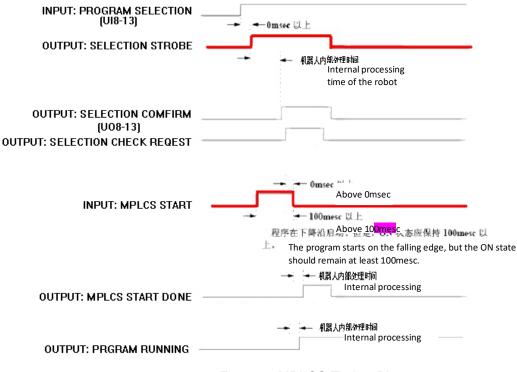

Fig. 4.48 MPLCS Timing Diagram

"MPLCS" is applicable to main programs with the attribute "Main".

Preconditions for "MPLCS"

- > The operation mode of the robot is the "auto mode".
- > The running status of the robot is "On-Standby".
- > The program execution status is "Finished".
- > The "program launch mode" is set as MPLCS.

MPLCS Simple Trigger

The process of MPLCS mode is relatively complex. In many scenarios, such a complex process is unnecessary (ordinary integration users also do not want too complex timing logic). So, the MPLCS Simple Trigger mode is provided. Compared to the complete mode, the simple mode simplifies the process of feeding back the received UI[8] - UI[13] signals for external confirmation.

- > The robot can find the START signal when it is in the "MPLCS Simple Trigger Mode" and the corresponding trigger conditions are met.
- It is considered necessary to start the program when the START signal shows a falling edge (from high level to low level). Then, UI[8] 1~UI[13] are read and combined into a decimal number as the program code. It tries to find the corresponding program to start and reports an alarm if not found.
- > Other mechanisms, e.g. pause and stop, are the same as the complete mode.

MPLCS Simple Trigger Mode is applicable to main programs with the attribute "Main".

Preconditions for "MPLCS Simple Trigger Mode"

> The operation mode of the robot is the "auto mode".

Operation Manual for Robot System

Operation Manual for Robot System

- > The running status of the robot is "On-Standby".
- > The program execution status is "Finished".
- > The "program launch mode" is set as MPLCS Simple Trigger Mode.

Macro Trigger

Macro Trigger is to trigger a macro program through pre-configured I/O, as detailed in Chapter 4.2.1.

Preconditions for Macro Trigger

- > The operation mode of the robot is the "auto mode".
- > The running status of the robot is "On-Standby".
- > The program execution status is "Finished".
- > The "automatic program launch mode" is set as Macro Trigger.

Macro Trigger is applicable to macro programs.

Additional descriptions

- 1. When the program type is selected as Main, the functions of "program start point" and "program number" are additionally shown on the program property interface. The programmer is allowed to choose whether to disable the "Program Start Point" function as shown in Fig. 4.49. Please refer to Section 4.3 for details.
- 2. The program number ranges from 1 to 255. However, since only 6 system signals are used to call Main programs and the maximum decimal number composed of 6 signals is 64, the maximum program number for external calls to the Main program is 64.

Program	Property Program Adapt Model Name: GBT-P7A-900 ×

Fig. 4.49 Program Property Window

3. None - general programs: There are no special restrictions or distinctions. In the auto mode, it cannot be started by any means other than Local Trigger mode (manually pressing the start button). However, it can be called by other programs.

Operation Manual for Robot System

- 4. Macro Macro program: During execution, a macro program can be called through macro start.
- 5. Introduction to macro program launch mode: The user can set it in the special program settings (macro settings) interface and each macro program corresponds to a DI one by one. A macro program can be started through pre-set I/O.
- 6. To start the main program through "MPLCS" or "MPLCS Simple Trigger", the TP mode selector must be in the auto mode.

4.3 Program start point

The user can set the program start point (i.e. home point) for the automatically running program in order to prevent unpredictable danger or injury when the program starts automatically in the auto mode, for the robot's current position is not at the program's start point planned by the programmer and the first path planned is different from the debugging process and does not meet the programmer's expected path to the first target point. Successively click "Menu Button" \rightarrow "Program" \rightarrow "Start Point" to enter the screen as shown in Fig. 4.50.

The elements of program start point include:

- > J1-6 is the joint information for this pose. Unit: angle.
- > ID: The ID number of the pose can be modified.
- Comment: support 128 bytes.
- Name: support 32 bytes.
- Float value: The positive/negative floating range during verification of Home point. Unit of display layer: angle. The allowed range is 999.999 with a default value of 0.5.

The user can add or delete the home point of the program and record the current point as the home point by clicking the "Teaching Log" button at the bottom of the page. Click the "Edit" button to change the value and floating value of the robot axis. In order to quickly teach the robot to the recorded program home point, the user can use the "Move to Point" button to move the robot to the home position.

Fig. 4.50 Program Home Point Window

4.4 Execute programs

4.4.1 Trigger the program in manual mode

Executing a program in manual mode is also known as "program debugging and execution". The robot program can be executed according to the following steps:

- 1. Set the TP mode selector to the manual mode (manual maximum speed or manual limit speed).
- 2. Open the program to be executed (refer to Section 4.1.4 for program opening).
- 3. Choose how to execute the program (continuous, single step & positive sequence, single step & reverse sequence)

Fig. 4.51 Selection of Program Execution Modes

4. Select the statement from which line to execute the program. The selected statement is highlighted as shown in the following figure.

4	MOVEL P[3:], 500mm/s, FINE]
5	MOVEL P[4:], 500mm/s, FINE	
6	MOVEL P[1:], 500mm/s, FINE	

Fig. 4.52 Program Window

- 5. Click the "Arrow to Cursor". Execution will start from the selected line when the program is triggered.
- 6. Press the Enable button on the back of TP and keep it at the middle gear.

Fig. 4.53 Enable Button

- 7. Press the "Reset" button on TP to clear alarm and other information and activate the robot (observe if the TP status lamp "Servo ON" turns green).
- 8. Press the Start button to run the program.

4.4.2 Execute the program in auto mode

The user can only execute programs continuously in auto mode.

Moreover, in the auto mode, the program must be executed through the "automatic trigger mode" specified by the system settings or resumed from the pause status.

Only when the status is in "ON-standby" in the robot's running status bar (and the program status is not in "Paused" or "Running") can it be started through the automatic program trigger mode.

In the auto mode, simply press the "Start" button or send a "Restart" UI signal to the controller to resume the execution of a paused program.

Multiple ways can be adopted to start the program in the auto mode. Please refer to Section 4.2.2 for details.

The robot program can be executed according to the following steps:

- 1. Open the program to be executed (Do not open the program when it is called through the program number or macro instruction. The corresponding program should be opened only during manual execution.)
- 2. Set the mode selector to the auto mode (A).
- 3. Press the "Reset" button on TP or send a UI signal of "Restart" to the controller to clear alarm and other information and activate the robot (observe if the TP status lamp "Servo ON" turns green).
- 4. Start the corresponding program according to the set program trigger mode (directly press the TP Start button, send the DI trigger signal with the specified macro or launch the program according to the timing sequence specified by the main program trigger mode).

4.4.3 **Program pause and abort**

Pause

The robot's program is paused for some reason during operation. After pause, the program arrow stops at the executing program line.

The following actions may cause pauses:

- ➢ When the program is running, the user clicks the Pause button; or the robot receives an external Pause signal.
- There will be alarms causing "pause" behavior, such as "STOP", "Pause", "Servo 1" and other level alarms. When a program is executed in single step or reverse order, it may enter a pause state after each instruction is executed.
- A "Pause" instruction is executed during program execution.

🚹 Caution

The alarm levels of STOP and Servo 1 can cause the abortion of the motion. However, they only cause the program to pause. For example, triggering the safety door signal can cause a "STOP" alarm. Although the motion stops instantly, the program turns to a pause state.

Abort

There are two abort states: program abort and motion abort.

Program abort

Program abort: The robot's program can be paused for some reason during operation. After abort, the system maintains the sequence number of the instruction line just being executed. Please note: normal completion of the program or execution of abort instruction is also considered as a special case of program abort.

If a subprogram called by a higher-level program is aborted during execution, the information returned to the higher-level program may be lost and the subprogram cannot be independently started and executed again or return the information to the higher-level program after execution.

The following actions may cause program abort:

- The user clicks the Pause button twice. The interface will pop up a box indicating whether to stop current program. Click "Confirm".
- > An alarm possibly causing "program abort" occurs.
- > AN "End" instruction is executed during program execution.
- > A "Abort" instruction is executed during program execution.

Motion abort

Motion abort: The general motion abort of the robot refers to power-off of the servo motor and application of the brake. It is not required to distinguish whether the robot is moving, decelerating or stationary at this time, but the servo is powered off and the brake is applied directly.

Generally, motion abort may not necessarily cause program abort, but may result in program pause (e.g. when the e-stop button is pressed); program abort does not necessarily trigger motion stop as well. It is possible that the program has ended and the robot is still running and waiting for the instruction to execute another program.

The following actions may cause motion abort:

- The user clicks the Pause button twice. The interface will pop up a box indicating whether to stop current program. Click "Confirm".
- > An alarm possibly causing "motion abort" occurs.
- > A "Abort" instruction is executed during program execution.

4.4.4 Resume after pause

When the program execution status of the robot is "Pause", the user can click the Start button to resume the program start if the robot's running status is "On-Standby" and no alarm above "Pause" level is valid.

4.5 Program monitoring

Successively click "Menu Button" \rightarrow "Program" \rightarrow "Program Monitoring" to enter the program monitoring screen.

The program monitoring screen is as shown in the figure below:

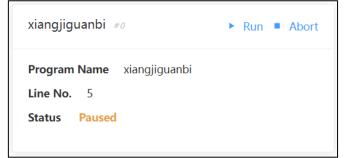

Fig. 4.54 Program Monitoring Interface

Click konner to switch between "Run" and "Pause". "Run" means to execute the program and "Pause" means to pause the program. Click Abort to stop the program.

Status:

- Running
- Pause
- > Abort (then, the program will disappear)

\land Caution

For Python script programs, Pause is invalid, while Abort is valid.

5 Status display

5.1 Register management

The registers used by the Agilebot robot include number register (R), motion register (MR), pose register (PR), string register (SR), socket register and Modbus register.

5.1.1 Number register

The number register (R[i]) is displayed and set on the number register screen.

Successively click "Menu Button" \rightarrow "Data" \rightarrow "Number Register" to enter the number register setting screen as shown in Fig. 5.1.

Fig. 5.4 Pose Register Setting Interface (Joint)

It is allowed to create or delete registers on the pose register setting interface; perform data switching between Cartesian coordinate system (Fig. 5.3) and joint coordinate system (Fig. 5.4) by

Description of pose register parameters

- ▶ ID: Register number
- Group ID: "1" represents the robot body, while other values represent external axes. Currently, only "1" is supported for body representation.
- Name: Appoint the name of motion register here. The name can be composed of characters less than 31 bytes, but is not allowed to contain: #\$%^&*()@+-=/\,;;"""|<>~{}
- Comment: Add a comment to the motion register here. The comment may contain up to 128 bytes of characters.
- > Value: Set the register value here. Range: an integer within the range of ±99999999.
- The values (X, Y, Z, A, B, C) in the Cartesian coordinate system represent poses of the specified TCP in the specified user/base/world coordinate system.
- The values (J1, J2, J3, J4, J5, J6) in the joint coordinate system represent the angles of each robot joint.

Writing of coordinates

- Current robot coordinates can be recorded by the "Teach Record" button (this value does not include the information of user and tool coordinate systems). So, when the PR pose register is used in the program, it is necessary to use UF_No and TF_No instructions to specify the user or tool coordinate system in advance. Spatial positions represented by the PR register may not necessarily be the same under different user or tool coordinate systems. Current coordinate system is used if no coordinate system is specified in the program.
- It is also allowed to fill in coordinate values by clicking the "Edit" button. After that, click "Save" to complete the filling.

In the manual mode and with the servo powered on, click "Move to Point" on the pose register interface. Then, the robot will move to the point in the pose register.

5.1.4 String register

The string register (SR[i]) is displayed and set on the string register screen.

Successively click "Menu Button" \rightarrow "Data" \rightarrow "String Register" to enter the string register setting screen as shown in Fig. 5.5.

Operation Manual for Robot System

- Comment: Add a comment to the string register here. The comment may contain up to 128 bytes of characters.
- > Value: Set the register value here. It can contain 255 bytes at most.

After setting of the above parameters, click "Save".

5.1.5 Socket register

It is used in conjunction with socket instructions (see Section 3.8.10 for socket instructions).

Overview

The robot acts as Socket Client or Server to perform socket communication with other devices.

Operation process:

On the Socket register page, configure the robot as a Client or Server parameter, such as communication protocol, IP, port, etc.

Call the Socket program instruction when writing a program.

Position

Successively click "Menu Button" \rightarrow "Data" \rightarrow "Socket Register" to enter the socket register setting screen as shown in Fig. 5.6 and Fig. 5.7. TCP and UDP can be selected as functional protocols. The robot can be used as Server or Client, of which configuration items are different.

Description of socket register parameters

- ▶ ID: Register number.
- Name: Appoint the name of string register here. The name can be composed of characters less than 31 bytes.

Robot as Server (as shown in Fig. 5.7):

- Server IP represents the IP of the robot.
- The server port represents the port number used by the Socket. It is used when the Client is connected.
- The default time of receive-timeout represents the waiting time when data is received from the Socket. It will not wait beyond this time. The return value of the corresponding program instruction for receive-timeout is 999.

Robot as Client (as shown in Fig. 5.6):

- Server IP represents the IP of the server to be connected by the robot on the opposite end. It is input by the user.
- Server Port represents the port of the server to be connected by the robot on the opposite end. It is input by the user.
- Client IP represents the IP of the robot (which cannot be changed in the interface shown in Fig. 5.7).
- > The default time of receive-timeout is the same as the Server.

5.1.6 Modbus special registers

They can be used to monitor Modbus registers and currently support monitoring of slave Input Registers and Holding Registers.

Among them, Holding Registers are represented by MH[i] and Input Registers by MI[i], where i is the sequence number. Total number of each register can be configured to 120 at most.

Successively click "Menu Button" \rightarrow "Data" \rightarrow "Modbus Special Register" to enter the Modbus special register setting screen as shown in Fig. 5.8.

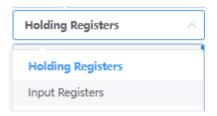

L Caution

Before entering the Modbus Register screen, the Modbus slave function must be activated. Otherwise, an error may occur when entering the Modbus Register page.

- 5. Enter the I/O status screen to monitor and operate DI/DO.

* For more detailed configuration, usage and practical cases of Modbus, please refer to the *Agilebot Modbus TCP Function Manual*.

5.2 Current position

It is the current position interface (as shown in Fig. 5.11) mainly used to provide the user with real-time information about the robot's current pose during robot teaching; and provide the user with a convenient function to move to a confirmed target point.

This interface consists of two parts: Positions in Coordinate (current position) (Area 1 in Fig. 5.11) and Go To Position (target position) (Area 2 in Fig. 5.11) of the robot.

Fig. 5.12 Current Position Interface (Joint)

Click to choose world coordinate system, base coordinate system, joint coordinate system or user coordinate system. If the world, base or user coordinate system is selected, the coordinates of current robot's TCP in the corresponding coordinate system will be displayed. If the joint coordinate system is selected, joint coordinates of current robot will be displayed. (It is independent of the "Current Coordinate Selection" on the status bar).

Click Unit: degree 🗸

to convert angle units: angle system or radian system.

Description of "Go To Position" area

The user can input the specified target point (it is allowed to input Cartesian or joint coordinate data and

click <u>Cart</u> Joint to switch data types). After that, the robot is enabled to power on. Press and hold the "Move to Position" button so that the robot can slowly move to the target point in a relative motion mode (MoveJ).

During the movement, the user must hold the "Move to Position" button until the robot reaches the target point. Otherwise, the robot may immediately slow down and stop.

6 Robot communication setting

Summary

Agilebot robots are provided with the Modbus TCP protocol, so that the customers can communicate with peripheral devices through buses.

Modbus TCP is an open master/slave application communication protocol. Currently, Agilebot robots can only support the slave function. 4 transmission data formats are as follows:

Function	Туре	Authority	Robot mapping
Discrete output (coils)	Single bit	Read and write	Digital Input
Discrete input (coils)	Single bit Single bit	Read only	Digital output
Input Registers	16-bits word	Read only	MI register
Holding Registers	16-bits word	Read and write	MH register

Slave configuration

Successively click "Menu Button" \rightarrow "Communication" \rightarrow "Bus Configuration" to enter the Modbus slave configuration screen as shown in Fig. 6.1.

Fig. 6.1 Current Position Interface

Description of parameters:

- IP address: Slave (robot) address
- > Port number: The port used for communication with the master station
- Name: Slave Name

Response delay: The latest response time specified for communication between master and slave stations

Slave setting steps

- 1. In Fig. 6.1, it is necessary to first turn off the Enable state if the slave function is enabled. Then, the configured IP address must be in the same domain as the robot (the default IP of the robot is 192.168.110.2) and the name and response delay of the slave station cannot be kept blank.
- 2. Click "Function" in Fig. 6.1 to enter the register setting interface shown in Fig. 6.2.

* For more detailed configuration, usage and practical cases of Modbus, please refer to the *Agilebot Modbus TCP Function Manual.*

7 System backup and loading

- > Prevent accidental damage or loss of programs or software during use or transmission.
- > Before program modification, make a backup of the source program for convenient recovery.
- > Overall coverage or loading of robot software, programs and files.

7.1 Allowable storage devices

Storage devices in FAT32 format, with USB-A interface, USB2.0 protocols and 8G-32GB capacity, such as USB flash drives, mobile hard drives, etc.

The recommended USB drive brands and models are shown in the table below:

Brand	Model	Capacity
Kingston	DTXM	32G
SanDisk	CZ73	32G

Caution

The USB memory has security features and the product requiring password authentication when accessing to the drive cannot be used.

7.2 Backup and load objects

Data

- User's program files
- Data files
- System setting files
- TP config files
- MCCP files
- ➢ Logs

Software

- Robot application software
- Robot motion control software

L Caution

Exclude operating system and underlying drivers.

Selection of backup method:

- A. Single file backup (file management interface): Choose a single file for backup and save it to a folder in the designated USB drive path.
- B. Single type backup (file management interface): Choose a file type, back up all files of this type and save them to a folder in the designated USB drive path.
- C. All backup (file management interface): Back up all files and save them to a folder in the designated USB drive path.
- D. Mirror backup (file management interface): Mirror all contents listed: all files, robot application software and robot motion control software, and save them in zip or other form to a designated USB drive.

Selection of load method:

- A. Single file loading (file management interface): Designate a path and select a single file for loading.
- B. Single type loading (file management interface): Designate a path, check a file type and load all files of that type in this directory.
- C. All loading (file management interface): Choose the folder on the USB drive and load all recognizable robot files in this directory.
- D. Mirror loading (file management interface): Choose the mirror zip package in the folder on the USB drive, select the mirror loading mode, decrypt and decompress the zip package and replace all files and installed software in the controller and TP (not involving operating system). Generally, this method is used to restore software to a certain version or recover a debugged robot engineering application as a whole.

7.3 Description of other functions

- Path browsing: It provides path browsing and selection functions for backup and restore/loading. It is allowed to open the folder in the path of Cabinet-USB\AgilebotRobotBackup in the USB drive until you select the desired subdirectory.
- File recognition: During backup and restore/loading, only mirror files (.zip) and common folders in the path of Cabinet-USB\AgilebotRobotBackup can be recognized. It is required to ensure that this directory only contains files related to the robot system.
- Folder edit: It is allowed to create, delete and edit the named folders in the directory of Cabinet-USB\AgilebotRobotBackup.
- Overwrite prompt function: When restoring/loading to the controller, please confirm whether to overwrite the files with the same names (if any). The options include "Confirm to Overwrite", "Skip", "Cancel Backup/Load (previously overwritten files cannot be restored)" and there is a check box "Perform the same operation for subsequent files".
- > Progress confirm: display backup or loading progress.

7.4 User's operation mode

Backup:

- 1. Insert the USB drive into the USB port on the robot controller (TP USB port does not support backup operation).
- 2. Switch the robot to the SERVO_OFF state. Click "Menu Button" → "Management" → "File Management" → "Backup" and open the file management interface, as shown in Fig. 7.1.

Operation Manual for Robot System

Operation Manual for Robot System

Operation Manual for Robot System

- 5. Select the destination folder for backup and click "Start Backup".
- 6. Wait for the system to complete the execution.

Mirror:

- 1. Insert the USB drive into the USB port on the robot controller (TP USB port does not support backup operation).
- 2. Switch the robot to the SERVO_OFF state. Click "Menu Button" → "Management" → "File Management" → "Backup" and open the file management interface.
- 3. Click on the "Mirror" button.
- 4. Select USB path and specific operating directory. If necessary, create or edit folders.
- 5. Select the destination folder for backup and click "Start Backup".
- 6. Wait for the system to complete the execution.

Restore/Load:

- 1. Insert a USB.
- 2. Switch the robot to the SERVO_OFF state. Click "Menu Button" → "Management" → "File Management" → "Restore/Load" and open the file management interface.
- 3. Select USB path and specific operating directory.
- 4. Select the files to load and click "Start Restore"; wait for the system to complete the execution.

Restore/Load	\times

The currently selected file: folder_20231113	

Fig. 7.4 Restore File Directory Interface

Precautions

- > Authority: This operation can be performed under admin.
- Execution conditions: The robot is in the manual mode, does not perform any motion instructions (regardless of teaching or programming) or is idle.
- > It is necessary to restart the controller and TP after mirror restore.
- > No other software operations are allowed during loading or backup.

8 **Practical functions**

8.1 Program offset

For a certain range of action statements in the program, the recorded poses in motion statements are uniformly transformed according to pre-specified rules and then the transformed program is treated as a new program or segment.

Offset type

- General offset: parallel or parallel-rotation offset
- Mirror offset: symmetrical offset relative to the designated symmetry plane
- Circular array offset: Angular offset around the rotation axis on the same circumference

Typical application scenarios

Fig. 8.1 Pose Data Offset Based on Certain Pattern Fig. 8.2 Regular Repeating of Pose Data

Steps:

Click "Menu Button" \rightarrow "Application" \rightarrow "Program Offset" to enter the function setting interface as shown in Fig. 8.3;

Operation Manual for Robot System

Fig. 8.3 Program Offset Setting Interface

- 2. Source Program: Choose the program name to be offset in the "Source Program" field. If offsetting a certain range in the Source Program, choose "Part" in the "Transform Scope" and enter the specified line number in the "Program Scope";
- 3. Target Program: Enter a new program name in the "Target Program" field, and the offset instructions will be generated in the new program. If an existing program name is entered, it is required to specify the line number to be inserted into the existing program in the "Target Line";
- 4. Offset Type: Choose General Offset, Mirror Offset or Circular Array Offset in the "Offset Type".
- 5. After setting, click "Do Transformation" to generate a new point.
- 6. Click "Save" to generate a new program.

Precautions:

- > Offset calculation is only allowed for P[] rather than PR[].
- > Cart and Joint points are kept unchanged after offset.
- > The offset of Joint point fails if beyond the soft limit after offset. This point is used as the value of the untaught log in the copied program.
- > If being offset according to the rules, Cart points are not used in reachability judgment.

8.1.1 General offset

General offset

• Directly input X, Y and Z offsets.

Reference poses: 1 source pose and 1 target pose

8.1.3 Circular array offset

No rotation axis is designated.

• Reference poses: 3

Rotating surface: form a rotating surface automatically by 3 points

Rotation axis: The center of a circle formed by three points is perpendicular to that of the rotating surface.

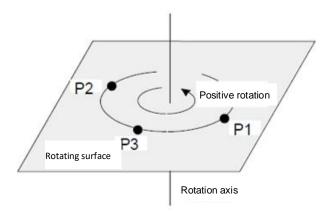

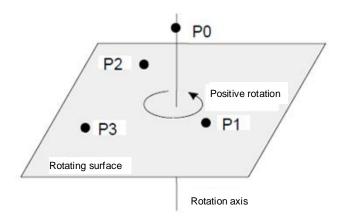

Fig. 8.8 No Rotation Axis Designated

Rotation axis designated

• Reference poses: 3 reference poses and 1 pose on the rotation axis

8.2 Basic space anti-interference

Interference prevention function in basic space: When other robots or peripheral devices enter the predetermined interference region, the robot may automatically stop until it is confirmed that other devices have moved from the interference region, even if a motion command is issued to the robot to enter the interference region. Then, the stop state is released and the robot automatically restarts the action. Meanwhile, corresponding outputs can be set. The robot can determine the position of the TCP point in real-time. When TCP enters the interference region, the designated DO state is set to OFF, informing peripheral devices that the robot has entered the interference region. Corresponding DO will be set to ON after TCP leaves the interference region.

Setting steps:

1. Click "Menu Button" \rightarrow "Application" \rightarrow "Reference Pose" \rightarrow "Basic Space Anti-interference" \rightarrow "New" to enter the configuration interface, as shown in Fig. 8.10.

	priority				space		
					inside/outside		

Fig. 8.12 Basic Configuration Interface

1. Input signal:

Set the input signal (customized signal) to input whether other robots or external devices have entered the interference region.

When the input signal is disconnected and the robot tries to enter the interference region, the robot gets into a hold state. When the input signal is connected, the hold state is released and the system automatically restarts.

The robot decelerates and stops from the moment it enters the interference region from the center point of the tool. So, the actual stop position of the robot is where it enters the interference region.

2. Output signal:

Set the output signal (customized signal). The output signal is disconnected when TCP exists in the interference region and connected when TCP is outside the region.

- > The output signal is connected under the safety status (outside the interference region).
- > The output signal is disconnected under the hazard status (inside the interference region).
- 3. Monitoring priority:

Make clear which robot has priority in entering the interference region when this function is used on two robots and these robots attempt to enter the interference region simultaneously. It should be designed that the robot on the "high" (priority) side enters the interference region first, performs and completes the operation and exits the interference region, and then the robot on the "low" (non-priority) side can enter the interference region. In addition, 2 robots must be arranged with different settings from the other side.

4. Monitoring space (inside/outside):

Appoint the inside or outside of the set cut as the interference region.

Introduction to space region configuration interface:

			Spac	ce reg	ion Configuration	ı			
JF D	0	\sim			*	0)	\sim

← Back List									✓ Save

Contents of space region configuration	Description
UF	Choose the user coordinate system.
TF	Choose the tool coordinate system.
Space shape	Cube at default
Shape determination method	Vertex + Side Length: The length from the base vertex to the side of the cube along Axes X, Y and Z of the user coordinate system (each side of the cube must be parallel to the coordinate axis of the user coordinate system). Vertex + Diagonal Vertex: The interference region is a cube with reference and diagonal vertices.

Setting steps for Vertex + Side Length method:

- 1. Set vertices of the interference region. Move the currently activated TCP of the robot to the position set as the vertex of the interference region, and click on "Teach Record". Then, the current TCP position is set as a vertex of the interference cube. It is also allowed to directly input the coordinates X, Y and Z.
- 2. Specify side length of the cube along Axes X, Y and Z of current user coordinate system from vertices in the side length column.

				Spa	ace re	gion Configuration	ı

Fig. 8.15 Setting by Vertex + Diagonal Vertex Method

8.3 Reference pose

The reference pose is one or several pre-set specific poses. After this function is enabled, the system may check in real time whether the current joint angle of the robot is within a certain range of the set reference pose (the range can be set) and a specified signal is output. This function can usually be used to inform peripheral devices that the robot is in a specific safe position or whether it is at a safe pose before starting the robot program.

It is allowed to set 10 reference poses.

Enter the Setting Screen:

Successively click "Menu Button" \rightarrow "Application" \rightarrow "Reference Pose" to enter the reference pose setting interface as shown in Fig. 8.16.

9 Alarm list

9.1 Description of alarm event

Agilebot supports the following classification of alarm event levels and corresponding behavior strategies, as shown in Fig. 9.1:

	Behaviors ar	nd security strate	gies correspo	nding to a	larm levels
Event	Robot motion	Servo bus	User	Scope	Safe stop strategy
level		power supply	program		corresponding to alarms
INFO	Unaffected	Unaffected	Unaffected		None
PAUSE.L	Stop after	Not break	Pause	Local	None
PAUSE.G	deceleration	(release)		Overall	
STOP.L	Stop after	Break		Local	Type: Class 1 stop
STOP.G	deceleration			Overall	
SERVO1	Instantaneous			Overall	Type: Class 0 stop
	stop				
ABORT.L	Stop after	Break	Abort	Local	Type: Class 1 stop
ABORT.G	deceleration	(braking)		Overall	
SERVO2	Instantaneous	Break		Overall	Type: Class 0 stop
SYSTEM	stop	(braking)		Overall	Type: Class 0 stop
					It is a major issue related
					to the system. After this
					alarm occurs, all robot
					operations should be
					prohibited. After it is
					solved, it is necessary to
					shut down, restart and
					initialize the system.
Warning	Unaffected	Unaffected	Unaffected		None

Fig. 9.1 Event Levels and Strategies

Description of current alarm event:

Events with a level above "Info" (exclusive) are defined as alarms.

"Current alarm" is a valid alarm not successfully reset yet, and the corresponding processing behavior of its "event level" may continuously generate restrictions or warnings on the system. Accordingly, the alarm, which has been reset, is no longer a current valid alarm but a past alarm. Such an alarm is not shown in the list of "Current Alarms" but in the "Event History".

The current alarm is displayed in the "Event Information" area of the UI status bar. It is used to remind the user whether there are still active alarms in the current system, so that the user can conveniently maintain and debug the robot.

Please note the following points:

- > Only current events with the highest level are displayed in the event information bar.
- > Events with "Info" or higher levels are displayed in the "Event Information" status bar.
- There is also an independent interface for displaying all current alarms, but the events at the "Info" level are not displayed in this interface (for Info is not actually an alarm).

9.1.1 Relevant interfaces and function descriptions

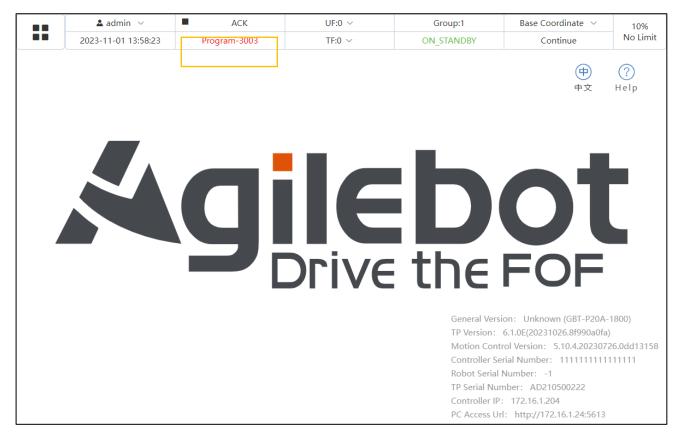

Fig. 9.2 Event Information Area in Status Bar

The alarm event status bar is shown in Fig. 9.2. The user can click event information area on this status bar to enter the current alarm interface as shown in Fig. 9.3.

Act	tive Alarm		×
	Event Code	Description	Time
1	Operation-0021	The administrator has logged in with the defaul	2023-11-03 17:02:28
2	System-0092	free disk space on controller is 1M, less than 5	2023-11-03 17:02:02
3	System-0094	The version of the TP software and the file man	2023-11-03 17:01:07
4	Operation-2345	Operation state switched	2023-11-03 17:00:45

Fig. 9.3 Current Alarm Interface

The current alarm interface is to display all current alarms present in the system. They are sorted in chronological order from current to past. The user can click any alarm to enter its detailed description interface.

Event Detail		\times
9 System-0094 (WARNING)	2023-11-03	3 17:01:07
VERIFY_FILE_MANAGER_SERVICE_VERSION

Action		
	Previous	Next

Figure 9.4 Event Detail Interface

Fig. 8.4 shows an event detail interface for current alarm - single alarm. This interface provides specific and detailed description of a certain alarm, including code, level, name, description, consequence, cause and action. The user can switch among different alarms by Previous/Next. The switched list is related to the alarms on current alarm interface.

A Reset signal may be sent to the controller for resetting. After the controller completes resetting (successful or failed), the "Current Alarm" interface is refreshed. The alarms (if any) after resetting are displayed in the current alarm interface in chronological order. Without alarm, an empty page is shown and no alarm is displayed on the status bar of the TP interface.

The user can also click the History Event button on the current alarm interface to enter the History Event interface.

9.2 History event

Overview

Historical events record user's operations on the robot system as well as alarms, prompts and status transitions inside the system, for example, a series of events, such as user login, alarm, pause, motor power-on, contactor release, robot entering manual speed limit mode, reset, calibration, etc.

L Caution

Temporary storage size is 250M for an Event Log. Beyond this limit, a new log will overwrite the oldest one from the current time.

Fig. 9.5 Event Log/History Interface

Successively click "Menu Button" \rightarrow "Shortcut Menu" \rightarrow "History Event" to enter the history event log interface as shown in Fig. 8.5. This interface lists all events in chronological order from present to past.

The user can filter them through specific filters. There are two filters. One is based on alarm category or level selected by the user and the displayed contents are related to the category selected by the user; another is a time filter, of which the user can choose to display only event logs in a certain period of time.

If the user clicks an event entry in the event log, it will also automatically enter its detailed description interface.

10 List of SOCKET error codes

This chapter introduces the meanings of optional parameters in the SOCKET instruction (see Section 3.8.12)

Parameter	Meaning
0	Success
1	Operation not permitted
2	No such file or directory
3	No such process
4	Interrupted system call
5	Input/output error
6	No such device or address
7	
8	Argument list too long Exec format error
9	Bad file descriptor
10	No child processes
11	Try again
12	Out of memory
13	Permission denied
14	Bad address
15	Block device required
16	Device or resource busy
17	File exists
18	Cross-device link
19	No such device
20	Not a directory
21	Is a directory
22	Invalid argument
23	File table overflow
24	Too many open files
25	Not a typewriter
26	Text file busy
27	File too large
28	No space left on device
29	lllegal seek
30	Read-only file system
31	Too many links
32	Broken pipe
33	Math argument out of domain of func
34	Math result not representable
35	Resource deadlock would occur
36	File name too long
37	No record locks available
38	Invalid system call number
39	Directory not empty
40	Too many symbolic links encountered
40	Operation would block
41	No message of desired type
42	Identifier removed
43	Channel number out of range
45	Level 2 not synchronized
46	Level 3 halted
47	Level 3 reset

Operation Manual for Robot System

48	Link number out of range
49	Protocol driver not attached
50	No CSI structure available
51	Level 2 halted
52	Invalid exchange
53	Invalid request descriptor
54	Exchange full
55	No anode
56	Invalid request code
57	Invalid slot
58	Resource deadlock would occur
59	Bad font file format
60	Device not a stream
61	No data available
62	Timer expired
63	Out of streams resources
64	Machine is not on the network
65	Package not installed
66	Object is remote
67	Link has been severed
68	Advertise error
69	Srmount error
70	Communication error on send
70	Protocol error
72	Multihop attempted
73	RFS specific error
73	Not a data message
75	Value too large for defined data type
76	Name not unique on network
77	File descriptor in bad state
78	Remote address changed
79	Can not access a needed shared library
80	Accessing a corrupted shared library
81	.lib section in a.out corrupted
82	Attempting to link in too many shared libraries
83	Cannot exec a shared library directly
84	Illegal byte sequence
85	Interrupted system call should be restarted
86	Streams pipe error
87	Too many users
88	Socket operation on non-socket
89	Destination address required
90	Message too long
91	Protocol wrong type for socket
92	Protocol not available
93	Protocol not supported
94	Socket type not supported
95	Operation not supported on transport endpoint
96	Protocol family not supported
97	Address family not supported by protocol
98	Address already in use
99	Cannot assign requested address
100	Network is down
100	Network is unreachable
101	

Operation Manual for Robot System

102	Network dropped connection because of reset
103	Software caused connection abort
104	Connection reset by peer
105	No buffer space available
106	Transport endpoint is already connected
107	Transport endpoint is not connected
108	Cannot send after transport endpoint shutdown
109	Too many references: cannot splice
110	Connection timed out
111	Connection refused
112	Host is down
113	No route to host
114	Operation already in progress
115	Operation now in progress
116	Stale file handle
117	Structure needs cleaning
118	Not a XENIX named type file
119	No XENIX semaphores available
120	Is a named type file
121	Remote I/O error
122	Quota exceeded
123	No medium found
124	Wrong medium type
125	Operation Canceled
126	Required key not available
127	Key has expired
128	Key has been revoked
129	Key was rejected by service
130	Owner died
131	State not recoverable
132	Operation not possible due to RF-kill
133	Memory page has hardware error
999	Recv timeout
